

Camp Green, Canada!

Camp Green, Canada!

Did you know?

Chemical RV odour control products can:

- ⊙ Damage campground septic systems and municipal sewage systems
- ⊙ Contaminate groundwater and surface water
- ⊙ Reduce air quality in your RV
- ⊙ Affect your health

Why Camp Green?

RVers often use odour control products to reduce sewage smell in their RV. Some believe that chemical products also help break down the waste – but this simply is not true. Chemical treatment products with formaldehyde and ammonia substances may actually stop the break down of waste, reducing the air quality in your RV. In concentration, dumping these chemicals may also lead to failure of campground septic systems or groundwater contamination.

In early 2000, Environment Canada and Health Canada have recommended both formaldehyde and ammonia be declared toxic under *The Canadian Environmental Protection Act*. Use non-toxic products today.

What can YOU do?

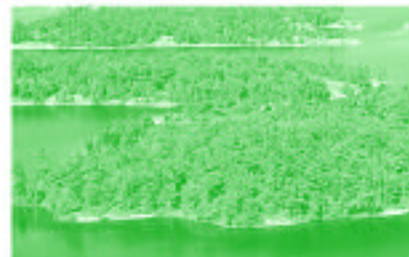

Non-toxic biological products are available that effectively control odours from holding tanks without causing harm to you or your environment. Ask for non-toxic products when you shop.

1. Contact Environment Canada to learn more information
2. Switch to non-toxic RV biological wastewater treatment products
3. Share your positive experience using non-toxic treatment products
