

Refrigerators

Fortunately, today's refrigerators are much better energy performers than older models; superior design, more efficient compressors and better insulation and door seals all help improve energy efficiency.

ENERGY STAR qualified refrigerators

The best energy performers are ENERGY STAR qualified refrigerators, which are indicated by a star (★) in the right-hand column of this directory.

ENERGY STAR qualified refrigerators are available in every category – including all sizes of standard and compact models – refrigerators with manual and partial automatic defrost, and all-refrigerators*.

To be ENERGY STAR qualified, standard-size refrigerators must exceed Government of Canada minimum regulated energy efficiency levels by at least 15 percent. Compact refrigerators must achieve energy efficiency levels that are at least 20 percent higher than the minimum regulated standard in Canada.

Refrigerator categories

Refrigerators are available in various sizes and with a variety of different features, all of which affect energy consumption. That's why EnerGuide groups refrigerators according to type and size, enabling you to compare the energy consumption of similar models.

For the purposes of this directory, refrigerators are listed according to three categories.

Refrigerators with automatic defrost

This category includes standard-size refrigerators, refrigerator-freezers and all-refrigerators* that feature automatic defrost (Types 3 to 7 on the EnerGuide label).

*The term "all-refrigerators" refers to models that have no freezer compartment.

Refrigerators without automatic defrost

This category includes standard-size refrigerators and refrigerator-freezers that do not feature automatic defrost (Types 1 and 2 on the EnerGuide label).

Compact refrigerators

This category includes all compact refrigerators and refrigerator-freezers (Types 11 to 15 on the EnerGuide label). These appliances have total refrigerated volumes of less than 219.5 L (7.75 cu. ft.) and overall heights of less than 91.4 cm (36 in.).

EnerGuide Label Refrigerator Type

Refrigerators without automatic defrost

Type 1 Refrigerators and refrigerator-freezers with manual defrost

Type 2 Refrigerator-freezers with partial automatic defrost (Partial automatic defrost is a system in which only the refrigerator portion of the appliance defrosts automatically; the freezer compartment must be defrosted manually.)

Refrigerators with automatic defrost

Type 3 Refrigerator-freezers with automatic defrost, with top-mounted freezer, without through-the-door ice service and all-refrigerators* with automatic defrost

Type 4 Refrigerator-freezers with automatic defrost, with side-mounted freezer, without through-the-door ice service

Type 5 Refrigerator-freezers with automatic defrost, with bottom-mounted freezer, without through-the-door ice service

Type 6 Refrigerator-freezers with automatic defrost, with top-mounted freezer and through-the-door ice service

Type 7 Refrigerator-freezers with automatic defrost, with side-mounted freezer and through-the-door ice service

Refrigerators – compact

Type 11 Compact refrigerators and refrigerator-freezers with manual defrost

Type 12 Compact refrigerators and refrigerator-freezers with partial automatic defrost

Type 13 Compact refrigerator-freezers with automatic defrost and with top-mounted freezer as well as compact all-refrigerator* models with automatic defrost

Type 14 Compact refrigerator-freezers with automatic defrost and with side-mounted freezer

Type 15 Compact refrigerator-freezers with automatic defrost and with bottom-mounted freezer

*The term “all-refrigerators” refers to models that have no freezer compartment.

Energy- and money-saving tips

- Be sure to read your new refrigerator's owner's manual; it's full of hints to help you operate your refrigerator at optimum efficiency.
- Refrigerator motors and compressors generate heat, so allow enough space for continuous airflow around your refrigerator. If heat can't escape, the refrigerator's cooling system has to work harder and use more energy.
- A full refrigerator is a fine thing, but be sure not to overfill the door and shelves. Restricting air circulation inside your refrigerator reduces its energy efficiency.
- Set your refrigerator temperature between 1.7 and 3.3°C (35–38°F) and the freezer compartment at –18°C (0°F) for maximum efficiency and food safety.
- Make sure your refrigerator's rubber door seals are clean and tight. They should hold a slip of paper snugly. If paper slips out easily, replace the seals. Here's another way to check the seals: place a lit flashlight inside the refrigerator and close the door. If you can see light around the door, the seals need to be replaced. Use the flashlight method to check freezers and ovens as well.
- When dust and pet hair build up on your refrigerator's condenser coils, the motor works harder and uses more electricity. Clean the coils regularly to make sure air can circulate freely.
- If you have an older, second refrigerator that is not in use, be sure to unplug it – it likely uses twice as much energy as your newer refrigerator does. When discarding your older refrigerator, check with your municipality about pick-up and recycling programs.
