

Natural Gas Market Update

October 2000

The monthly report “Natural Gas Market Update” provides a brief update on natural gas prices and on key factors affecting prices. The charts illustrate monthly data for the full year 1999 and year-to-date 2000.

NATURAL GAS PRICES

This figure illustrates the price of natural gas at the major Canadian pricing point – the AECO storage hub in Alberta. The price is for gas delivered under a 30-day contract. This is a commodity price – a wholesale price in the producing area. Consumer or burner tip prices will also include pipeline transmission and distribution costs, which vary across Canada.

Canadian natural gas commodity prices rose to \$6.53Cdn/GJ in October 2000, an increase of 24% from September. The average price from January to October 2000 is 62% higher than the same period in 1999.

Note: Canadian price is the Alberta price at the AECO Hub

HEATING DEGREE DAYS

HDDs are a measure of how cold it is. The more HDDs in any season, the greater is natural gas demand for space heating. If the winter is unusually cold, demand will respond accordingly and natural gas prices will tend to be stronger. However, if the winter is mild, demand will be weaker, and this will tend to moderate prices.

In August 2000, there were 39 HDDs, compared to 27 in August 1999. The period of January to August, 2000 saw 2% cooler weather than the same period last year.

DEMAND FOR NATURAL GAS

This figure illustrates total Canadian natural gas sales. Sales include all natural gas sold to residential and commercial users (for space and water heating, cooking, etc), industries and electricity generating units in Canada. The totals do not include consumption by the natural gas industry itself, for example, transporting natural gas through pipelines.

Natural gas sales to Canadian consumers for the period of January to August 2000 were 1,672 Bcf, an increase of more than 6% compared to the same period last year. Most of the increase occurred in the direct sales sector, which includes sales for power generation.

NATURAL GAS STORAGE

This chart indicates natural gas storage levels in Canada. The amount of gas in storage follows a seasonal pattern. Generally, in summer, when natural gas demand is low, gas is injected into storage. Storage volumes peak in the fall. In winter, volumes are drawn down, reaching a low point in the spring.

Canadian gas storage inventories increased by about 60 Bcf in October. However, storage remains 8% lower compared to last year. This partly explains the current high natural gas price environment.

NATURAL GAS DRILLING

This chart depicts the number of natural gas well completions in Canada. There is a time-lag between completing drilling of a gas well and starting production due to the work necessary to connect the new well to the pipeline grid. Drilling is therefore a good indicator of future natural gas supply prospects.

Natural gas well completions were 820 in October, 23% below the level of last October. Drilling from January to October 2000 is 34% higher than the same period last year and is on track to hit 8,650 wells for the full year, higher than the record of 6,200 wells set in 1999. These levels of drilling imply that higher Canadian production is forthcoming, which will put downward pressure on natural gas prices.

NATURAL GAS PRODUCTION

This chart shows marketable natural gas production in Canada. Marketable natural gas is the gas available for consumption after processing and excludes producer or plant uses.

Canadian production has increased steadily over time. As a result of the high drilling levels, production in 2000 is continuing to rise. Canadian marketable production for the year to date increased more than 2% compared to the same period last year, reaching 3,883 Bcf. About half of the increased production is due to the Sable project offshore Nova Scotia, while the other half is due to higher western Canadian production.
