

Natural Gas Market Update October 2001

The monthly report “Natural Gas Market Update” provides a brief update on natural gas prices and on key factors affecting prices. The charts illustrate monthly data for the full years 1999 and 2000, and year-to-date 2001.

NATURAL GAS PRICES

This figure illustrates the price of natural gas at the major Canadian pricing point – the AECO storage hub in Alberta. The price is for gas delivered under a 30-day contract. This is a commodity price – a wholesale price in the producing area. Consumer (or “burner tip”) prices will also include pipeline transmission and distribution costs, which vary across Canada. Natural gas is commonly measured in gigajoules (GJ) or cubic metres. A gigajoule is an energy unit which equates to about 27 cubic metres of natural gas.

Canadian natural gas commodity prices decreased 31% to \$2.10 Cdn/GJ in October 2001.

Note: Canadian price is the Alberta price at the AECO Hub

DEMAND FOR NATURAL GAS

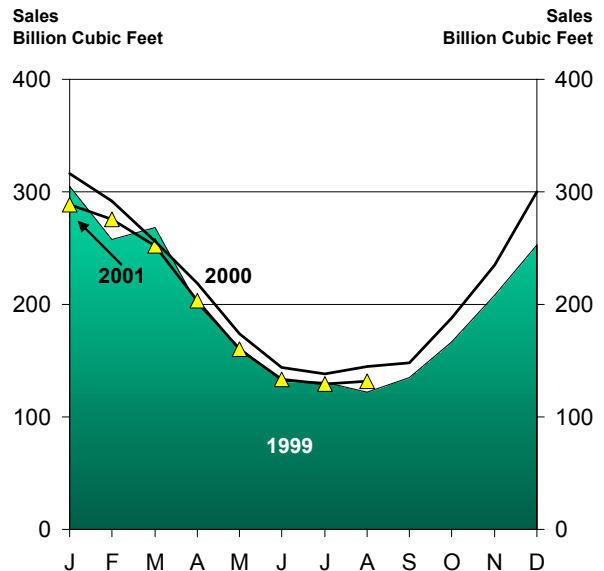

This figure illustrates total Canadian natural gas sales. Sales include all natural gas sold to residential and commercial users (for space and water heating, cooking, etc), industries and electricity generating units in Canada. The totals do not include consumption by the natural gas industry itself (e.g., pipeline compressor fuel).

Natural gas sales to Canadian consumers in August 2001 were about 132 Bcf, 9% lower than in August 2000.

HEATING DEGREE DAYS

HDDs are a measure of how cold it is. The more HDDs in any season, the greater is natural gas demand for space heating. If the winter is unusually cold, demand will respond accordingly and natural gas prices will tend to be stronger. However, if the winter is mild, demand will be weaker, and this will tend to moderate prices.

In August 2001, there were 15 HDDs, 62% less HDDs than in August 2000. August 2001 was 61% warmer than normal.

NATURAL GAS STORAGE

This chart indicates natural gas storage levels in Canada. The amount of gas in storage generally follows a seasonal pattern. In the summer, when natural gas demand is low, gas is injected into storage. Storage volumes peak in the fall. In winter, volumes are drawn down, reaching a low point in the spring.

Canadian gas storage inventories increased by 55 Bcf during the month of September 2001. Storage levels at the beginning of October 2001 were 1% higher than those of October 2000.

NATURAL GAS PRODUCTION

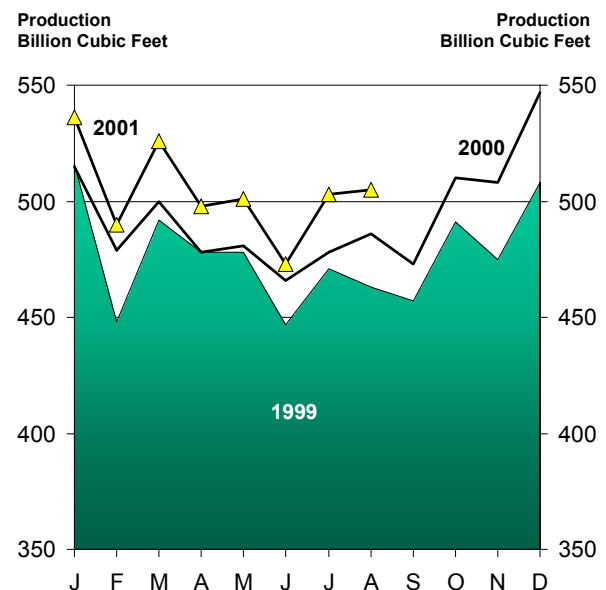

This chart shows marketable natural gas production in Canada. Marketable natural gas is the gas available for consumption after processing and excludes producer or plant uses.

Marketable natural gas production was 505 Bcf in August 2001, 4% higher than in August 2000. Year to date production for January through August is 4,031 Bcf, which is 4% higher than the same period last year.

NATURAL GAS DRILLING

This chart depicts the number of natural gas well completions in Canada. There is a time-lag between drilling a gas well and starting production, due to the work necessary to connect the new well to the pipeline grid. Drilling is therefore a good indicator of future natural gas supply.

There were 784 natural gas well completions in October 2001, a decrease of 11% compared to October 2000.
