Canada is an important world producer and supplier of refined lead, ranking seventh in mine production in 2003 after the United States, China, Germany, the United Kingdom, Australia and Japan. In Canada, primary lead is produced mainly as a co-product of zinc. Recycling of lead, mainly from scrapped car batteries, is an important source of refined lead in Canada, representing nearly 50% of total refined production.

HISTORY OF LEAD

Lead has been known since ancient times and is one of several metals that were discovered during the early periods of human history. Some experts believe that lead was used as early as 5000 B.C. The oldest archaeological evidence of lead use by humans is a figurine found in the Dardanelles area of Asia Minor dating from 3800 B.C.

Lead was used in coinage in China about 2000 B.C. and was mined by the Greeks from about 1200 B.C. to make coins, ornaments, weights and many other articles. One of lead's most enduring uses has been as pipe for the transportation of water. Romans manufactured lead pipes in one standard length and in several diameters, and used lead extensively in municipal water systems. The Roman word for lead is *plumbum*, which led to the modern English words "plumber" and "plumbing." The chemical symbol for lead, Pb, was also derived from the Latin word.

LEAD IN CANADA

An outcrop of lead-zinc ore was discovered in the Kootenay region of British Columbia in the 1820s. Active prospecting in the area dates from 1865 and mining commenced shortly thereafter. In the early years, the ores from British Columbia were sent to the United States for smelting and refining.

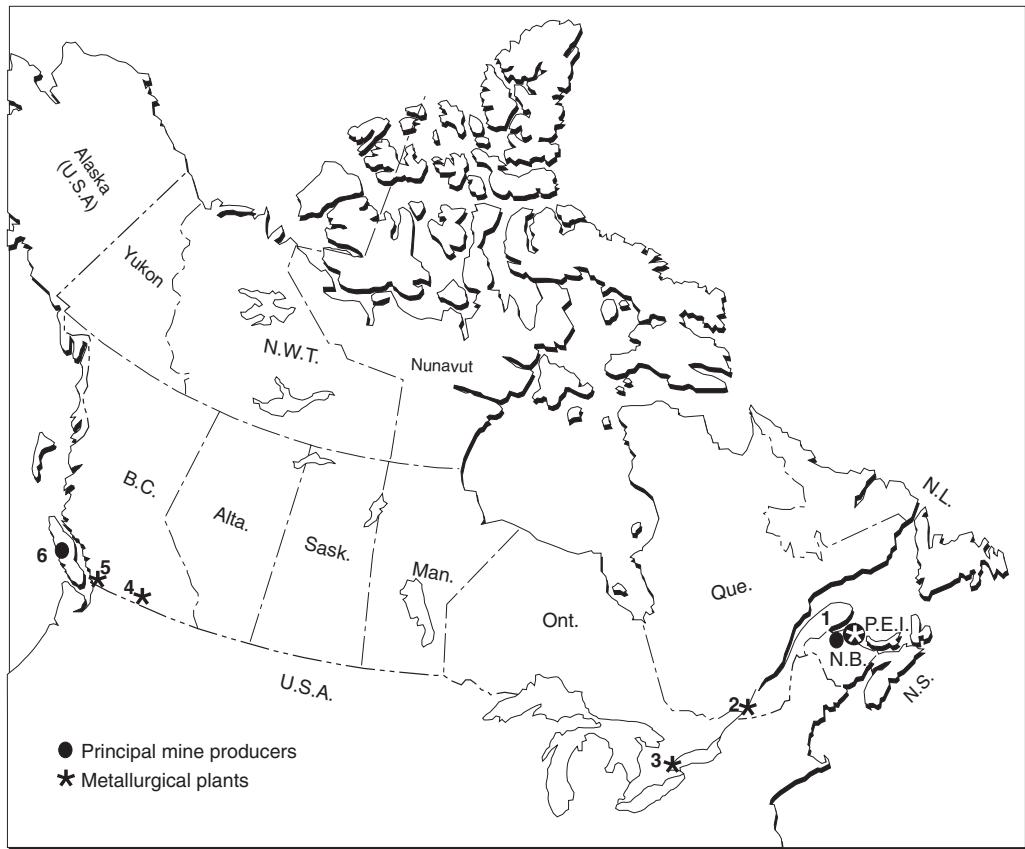

The now-famous Sullivan mine started operation near Kimberley, British Columbia, in the early 1900s and continued to produce lead until its closure in December 2001. By 1914, the Sullivan mine was the largest lead producer in Canada, a position it held for 50 years until the Pine Point mine in the Northwest Territories completed its first year of operation in 1966. Pine Point closed in 1988. The Kingdon mine at Galetta, on the Ottawa River near Arnprior, Ontario, was discovered in 1884, operated briefly in the 1880s, and was reactivated in 1914, producing lead and zinc ore until the early 1930s. The discovery of lead and zinc ores by the Geological Survey of Canada on Baffin Island in the mid-1950s led to the development of the Nanisivik mine in the mid-1970s. The mine closed in September 2002. The discovery of lead-zinc on Little Cornwallis Island in 1971 led to the development of the Polaris mine. Operated by Teck Cominco, the mine had the distinction of being the most northerly base-metal mine until its closure at the end of August 2002 after 20 years of operation.

Today, Noranda's operation at the Brunswick mine near Bathurst, New Brunswick, is the largest producer of lead. Lead has been mined in every province and territory with the exception of Alberta, Saskatchewan and Prince Edward Island. Operations in 2003 are listed in Figure 1.

USES

The largest single use of lead today is in the manufacture of the lead-acid storage battery, a vital part of every automobile. The average car battery contains about 10 kg of lead. Lead-acid batteries for automotive, industrial and consumer purposes account for about 75% of the world's demand for lead. In the communications industry, lead is still used extensively as protective sheathing for underground and underwater cables, including transoceanic cable systems. Certain lead compounds are used as paint pigments. Red lead (lead oxide) is the basic paint primer for iron and steel. Lead's corrosion-resistant nature also makes it suitable for applications in sheeting for roofing purposes, while its radiation attenuation properties prevent the emission of harmful radiation from television, video and computer screens.

Figure 2
Western World Lead Markets, 2003

Source: International Lead and Zinc Study Group.

International Lead and Zinc Study Group, it is expected that there will be a deficit of about 130 000 t in the Western World market for refined lead metal in 2004. This should translate into higher prices over the coming months with lead prices expected to average in the US\$800/t range in 2004.

Notes: (1) For definitions and valuation of mineral production, shipments and trade, please refer to Chapter 64. (2) Information in this review was current as of May 14, 2004. (3) This and other reviews, including previous editions, are available on the Internet at www.nrcan.gc.ca/mms/cmy/com_e.html.

NOTE TO READERS

The intent of this document is to provide general information and to elicit discussion. It is not intended as a reference, guide or suggestion to be used in trading, investment, or other commercial activities. The author and Natural Resources Canada make no warranty of any kind with respect to the content and accept no liability, either incidental, consequential, financial or otherwise, arising from the use of this document.

NATURAL OCCURRENCE

Almost all lead is obtained from sulphide ores in which the most common lead mineral is galena (PbS). It is usually found in combination with other sulphide ores, most frequently those of zinc, and also those of copper. Other lead-containing minerals include cerrusite (PbCO_3) and angulsite (PbSO_4).

PRICE OUTLOOK

Cash London Metal Exchange (LME) settlement prices for lead traded between US\$430 and \$500/t for the first half of the year and then followed a steady climb to reach a maximum of US\$739/t on December 31, 2003. Overall, cash settlement prices for lead averaged US\$515.66/t in 2003, an increase of 12% over the previous year. LME stocks followed a steady decline from a maximum of 183 725 t at the start of January to a minimum of 108 975 t at the end of December.

Lead concentrate markets have been particularly tight as more older mines close and fewer new projects with significant amounts of lead come on stream. The tight market is already being reflected by lower treatment charges and cutbacks at some smelters. Increased demand in Asian markets, particularly China, coupled with an overall decline in refined output, will continue to keep markets tight for lead. Overall, taking into consideration the information provided by the member countries of the

(a) Increase in number of companies being surveyed.

(1) Production includes recoverable lead in ores and concentrates shipped valued at the Montréal Exchange average price for the year. (2) Lead content of domestic ores and concentrates exported. (3) Imports from "other countries" may include re-imports from Canada. (4) Available data, as reported by users. (5) Includes all remelt scrap lead used to make antimonial lead.

(a) Lead in pigs, blocks and shot.

(1) Beginning in 1988, exports and imports are based on the new Harmonized System and may not be in complete accordance with previous method of reporting. Ores and concentrates include HS classes 2603.00.20, 2607.00.20, 2608.00.20 and 2616.10.20. Refined exports include HS classes 7801.10, 7803.00, 7804.11, 7804.19 and 7804.20. Refined imports include HS classes 7801.10.10, 7801.10.90, 7803.00, 7804.11, 7804.19 and 7804.20. (2) Recoverable lead in ores and concentrates shipped. (3) Primary and recycled in origin, as measured by a survey of users.
