Cement

Oliver Vagt

The author is with the Minerals and Metals Sector, Natural Resources Canada. Telephone: (613) 992-2667 E-mail: ovagt@nrcan.gc.ca

Dhipments of cement in 2001 were estimated to be 12.99 Mt valued at \$1.31 billion, based on preliminary data. This compares to shipments of 12.61 Mt valued at \$1.26 billion in 2000, based on final data (Table 1). Demand for cement in most regions remained firm as the result of an increase of about 5% in gross expenditures on construction and an increase in exports.

CANADIAN INDUSTRY

The Canadian cement industry is diversified and primarily integrated with the construction aggregates and concrete products sectors. Information on the aggregates sector is included in a separate chapter entitled Mineral Aggregates.

Clinker-producing and finish-grinding capacities of cement plants are listed in Table 2. Reported kiln capacity in 2000 was about 15.7 Mt with about 15.1 Mt active, according to the most recent figures available. Clinker production is more indicative of ultimate cement production capacity because clinker can be stockpiled for later use or sale. The overall output of the cement industry is best represented by total cement shipments plus clinker exports, as shown in Table 3. The average kiln capacity increased to 580 000 t/v in 2000; the average kiln age based on clinker capacity is reported to be about 20 years, according to the Portland Cement Association.

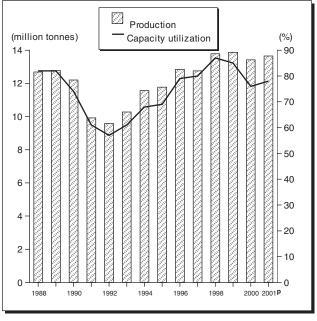

In the Atlantic region, the Lafarge Canada Inc. (Lafarge) plant in Nova Scotia is now the only cement producer in the region following closure in 2000 of the North Star Cement Limited plant in Corner Brook, Newfoundland and Labrador.

In Quebec, three clinker-producing plants account for about 17% of Canada's output. St. Lawrence Cement

Inc. (SLC), Lafarge, and Ciment Québec Inc. share markets about equally. (SLC continued with a permitting process to build a new 2-Mt/y cement plant near Greenport, New York.)

In Ontario, clinker-producing plants account for about 51% of Canadian capacity. The Blue Circle Canada Inc. clinker/cement plants located in Bowmanville and St. Marys, which were acquired in early 2001 by Lafarge SA of France via Lafarge's purchase of Blue Circle Industries PLC, were sold to Votorantim Group, one of the largest industrial conglomerates in Brazil and its leading producer of cement. This sale was part of a divestment in accordance with rulings by the Canadian Competition Bureau and the U.S. Federal Trade Commission. (The Ontario plants now operate under the name St. Marys Cement Co., as footnoted in Table 2; also, a

Figure 1 Canadian Cement Production, 1988-2001

Sources: Statistics Canada; Portland Cement Association. ^p Preliminary.

Note: Cement production includes clinker exports.

former Blue Circle Inc. plant in Detroit, Michigan, operates as St. Marys Cement Inc. (U.S.).

Western Canada's clinker-producing capacity accounts for about 29% of Canada's total clinker capacity. Both the Inland Cement Limited plant and the Tilbury Cement plant currently operate under the name Lehigh, as footnoted in Table 2.

WORLD DEVELOPMENTS

World cement production in 2000 was 1616 Mt, according to estimates by the United States Geological Survey (USGS). China is the world's largest producer (583 Mt), followed by India (95 Mt), the United States (90 Mt), and Japan (81 Mt).

U.S. anti-dumping duties against grey Portland cement and clinker from Mexico remained in effect in 2001.

USE AND TRADE

Cross-border trade of both cement and clinker varies considerably from year to year depending on construction activity. From 1999 to 2001, annual exports of cement to the United States amounted to 3.5-4.5 Mt and accounted for about one third of total Canadian production (shipments) as defined in Table 1. Exports are mainly destined for the southern Great Lakes and the U.S. Pacific northwestern regions. Similarly, Canada's imports of cement amounted to 0.6-0.8 Mt and related mainly to the equivalent regions.

Low-cost marine transportation has influenced world trade considerably. Total U.S. imports of cement (excluding clinker) for use were about 24 Mt in 2001, or 21% of apparent use. Asian sources (China, Korea and Thailand) have been major suppliers since 1998, according to the USGS.

The importance of supplementary cementing materials (SCMs) for a range of uses is well recognized. About 1.1 Mt of fly ash, accounting for about 22% of reported production, were used in 2001, according to a recent survey by NRCan in cooperation with the Canadian Electricity Association and Canadian Industries Recycling Coal Ash (CIRCA), as shown in Table 4. However, fly ash and other SCMs used for their pozzolanic properties are not differentiated in the international system of harmonized codes; hence, their recognition worldwide tends to be diminished. (Also, timely official data relating to the total use of these materials as inputs to the hydraulic cement industry [SIC code 3521, or the equivalent NAICS code 327310], as well as to the concrete products industry [SIC codes 3541, 3542 and 3549, or their equivalent codes 327330 and 327390], are not readily available.)

TECHNOLOGY

Energy conservation programs by the Canadian cement industry have reduced the energy consumption per unit of production by about 30% since 1974. Although the number of kilns has decreased, their individual capacities have increased and the more efficient dry-process plants now account for more than 95% of total active clinker capacity. The fuel mix has changed considerably away from natural gas and petroleum products toward coal and/or coke. In 2000, of 16 clinker-producing plants, 12 reported using coal and/or coke as their primary fuel. Seven plants reported using waste as an alternative or supplemental fuel, according to the Canadian Portland Cement Association (CPCA). In 2000, the Canadian cement industry consumed, on average, 4482 megajoules per tonne of production. The types of fuel consumed, including waste fuels, are highlighted in Table 2.

Suitable waste materials are an attractive alternative fuel because pyro-processing accounts for more than 80% of total energy needs, or 30-40% of total production costs. In the context of sustainable development of non-renewable fossil fuels, it is apparent that improved waste management involving combustion technology is leading to greater conservation.

Natural Resources Canada (NRCan) continued to seek ideas, advice and financial support for the new International Centre for Sustainable Development of Cement and Concrete (ICON). Although this centre draws on some current initiatives and the expertise of the Canada Centre for Mineral and Energy Technology (CANMET), it is dependent upon new partnerships with industry, academic institutions and other governments for strengthening global efforts relevant to the sustainable development of cement and concrete.

An awareness of the importance of high-volume fly ash concrete is growing; for example, the Greater Vancouver Regional District has established a new web site for EcoSmartTM concrete (high-volume fly ash concrete) in order to provide a forum for information about the benefits, costs and challenges associated with this type of concrete (www.gvrd.bc.ca/ services/air/air2000/Ecosmart/html). The EcoSmart Concrete Project also involves studying promising new techniques in intergrinding (blended cement) and precast (pre-manufactured) concrete. Some of these technical initiatives involve collaboration with CANMET and the Electric Power Research Institute (EPRI) of Palo Alto, California.

In late July and early August 2001, the Committee for the Organization of CANMET/ACI Conferences, the National Research Council's Institute for Research in Construction, and others sponsored the Seventh CANMET/ACI International Conference on Fly Ash, Silica Fume, Slag and Natural Pozzolans in Concrete, held in Madras, India, and the Fifth CANMET/ACI/International Conference on Recent Advances in Concrete Technology, held in Singapore. The Three-Day International Symposium on Sustainable Development and Concrete Technology to have been held in mid-September 2001 in San Francisco was cancelled.

In 2003, the Committee for the Organization of CANMET/ACI Conferences, the National Research Council's Institute for Research in Construction, and others are planning three international conferences relating to cement and concrete. These are: 1) the Sixth CANMET/ACI International Conference on Durability of Concrete to be held in Thessaloniki, Greece, on June 1-7, 2003; 2) the Sixth CANMET/ACI International Conference on Recent Advances in Concrete Technology to be held in Bucharest, Romania, on June 8-11, 2003; and 3) the Seventh CANMET/ACI International Conference on Superplasticizers and Other Chemical Admixtures in Concrete to be held in Berlin, Germany, on October 20-24, 2003.

Research efforts to develop new superplasticizers for use in conjunction with SCMs for high-performance concrete have increased in recent years. As a result of this, a publication entitled *Superplasticizers: Properties and Applications in Concrete*, by Ramachandran, Malhotra, Jolicoeur and Spiratos, was compiled to integrate the chemistry and applications concerned. This publication, which includes 14 chapters and more than 400 pages, can be obtained from the Materials Technology Laboratory (MTL) of NRCan's CANMET by contacting Alan Bowles by telephone at (613) 995-8814 or by e-mail at abowles@nrcan.gc.ca.

NRCan, mainly in collaboration with the Canadian Industry Program for Energy Conservation (CIPEC), continued to develop long-term strategies related to major energy-consuming sectors.

OUTLOOK

Cement shipments in 2002 are expected to be higher based on continued strength in the housing sector, relatively low interest rates, and growth in exports to the United States. Expenditures continued under the Infrastructure Canada Program involving federal, provincial/territorial and municipal governments. This program is expected to contribute about \$6 billion relating to both building and engineering infrastructure during the six-year period, including 2005.

Housing starts were about 163 000 in 2001, according to the Canada Mortgage and Housing Corporation. By way of comparison, housing starts were about 150 000 in 1999 and 152 000 in 2000. (Additional information relating to residential construction can be obtained on the Internet at www.cmhc-schl.gc.ca/ cmhc.html.) Non-residential construction and industrial construction permits are expected to be weaker in 2002 based on trends early in the year.

Energy management in the cement industry will continue to concentrate on gains in efficiency based on timely switching among the available choices of common fuels. However, most longer-term cost savings are expected to result from the partial substitution of fossil fuels by waste-derived fuels. For example, in selected regions, in the case of Refuse Derived Fuel (RDF), about 70% (by volume) of municipal solid waste from post-recycled curbside garbage could be extracted for use by the cement industry. This would reduce by about two thirds the volume of material for disposal as landfill. Under certain circumstances using RDF, reductions in requirements for traditional fuels have been predicted to be as high as 20-25%.

World production and use of cement in 2001 was 1.7 billion t, according to the U.S. Geological Survey (USGS). These amounts are forecast to be about 1.9 billion t and 2.1 billion t in 2005 and 2010, respectively, according to a report by Ocean Shipping Consultants Ltd. Of the overall forecasted 500-Mt increase, accepting the 1999 base-year amount of 1.6 billion t by the USGS, Asia is expected to account for more than 60%, Africa and the Middle East for 13%, and Central and South America for about 10%.

The use of supplementary cementing materials incorporating fly ash, silica fume or other pozzolanic materials such as ground, granulated slags as a partial replacement for energy-intensive Portland cement is expected to become more important in modern cement and concrete practices. An estimated 35-40 Mt of these products are currently used as a raw material or as partial replacement for Portland cement in North America and western Europe.

Notes: (1) For definitions and valuation of mineral production, shipments and trade, please refer to Chapter 64. (2) Information in this review was current as of February 1, 2002. (3) This and other reviews, including previous editions, are available on the Internet at www.nrcan.gc.ca/mms/cmy/index_e.html.

TABLE 4. CANADA, PRODUCTION AND USE OF COAL COMBUSTION **PRODUCTS (CCPs), 2001**^(1,2)

Sources: Compiled by Natural Resources Canada in cooperation with the Canadian Electricity Association and Canadian Industries Recycling Coal Ash (CIRCA).

Nil; n.a. Not applicable; FGD Flue-gas desulphurization.
(1) Reported production of coal combustion products (CCPs) may include both dry and ponded categories. (2) Use (domestic), as reported, includes amounts imported (assumed HS codes 2621.00 relating to fly ash and HS 2520.10 relating to gypsum). (3) Cfb (circulating fluidized bed) fly ash and bottom ash. (4) Includes waste stabilization and specialty uses such as mineral filler and flowable fill.
