Introduction

Overview

This publication summarizes and analyzes the latest information relating to one of Nova Scotia's most vital and dynamic sectors: the manufacturing sector. It concentrates on various facets of the manufacturing sector, including gross domestic product (GDP), costs and revenues, shipments, labour force characteristics, trade flows, and other indicators of the sector's economic performance. This first edition of the *Nova Scotia Manufacturing Profile* encompasses the entire 2001-2004 time frame and also makes use of the latest 2005 data available at the time of publication.

Primary Data Sources

Statistics Canada is the major source of the primary data in this report. The Economics & Statistics Division is responsible for all secondary treatment and analysis of this primary data, including calculations of year-over-year growth rates, compound average growth rates (CAGR), correlation coefficients, coefficients of variation, and labour productivity. This secondary treatment also includes the design and presentation of all charts and tables contained herein.

This edition of the *Nova Scotia Manufacturing Profile* makes use of the following Statistics Canada data sources:

- Annual Survey of Manufacturers (ASM) and Monthly Survey of Manufacturers (MSM)
- GDP by Industry
- Capital and Repair Expenditures Survey
- Labour Force Survey (LFS), Labour Statistics from the Canadian System of National Accounts (CSNA), and Survey of Employment, Payroll, and Hours (SEPH)
- Strategis Trade Data Online
- Business Conditions Survey

For more information about these data sources and their underlying methodologies, see the endnotes to the tables in Appendix B.

Defining the Manufacturing Sector

The following definition of the manufacturing sector is provided by Statistics Canada through Industry Canada's Strategis Web site:

The manufacturing sector is comprised of establishments that are typically designated as plants, factories, or mills. More specifically, these establishments are "primarily engaged in the physical or chemical transformation of materials or substances into new products. These products may be finished, in the sense that they are ready to be used or consumed, or semi-finished, in the sense of becoming a raw material for an establishment to use in further manufacturing. Related activities, such as the assembly of the component parts of manufactured goods; the blending of materials; and the finishing of manufactured products by dyeing, heat-treating, plating and similar operations are also treated as manufacturing activities."¹

According to the 2002 North American Industry Classification System (NAICS), the Canadian manufacturing sector is comprised of 21 manufacturing *subsectors*, which are further subdivided into manufacturing *industries*. Unless otherwise indicated, this publication uses NAICS to distinguish between sectors (2-digit NAICS code), subsectors (3-digit NAICS code), and industries (4-digit NAICS code) in the Nova Scotian and Canadian economies. This allows for a consistent and explicit means of analyzing and comparing economic data. For more detail about the NAICS classifications, particularly for the manufacturing sector, see Appendix A.

Notes: (1) Detailed statistics pertaining to some subsectors and/or industries may be kept fully or partially confidential by Statistics Canada under the Statistics Act. This may be due, in part, to the relatively small size of a subsector or industry or the dominance of a few large firms within a subsector or industry. (2) Unless otherwise indicated, dollar values reported herein are stated in nominal dollars as opposed to real dollars.

¹ Industry Canada, Strategis, *Canadian Industry Statistics*, http://strategis.ic.gc.ca/canadian_industry_statistics/

Synopsis and Outlook

Without question, the manufacturing sector in Nova Scotia, and Canada as a whole, has been met with many challenges and opportunities in the five-year period between 2001 and 2005. With emerging technologies, changing consumer demands, and a dynamic global business environment, Nova Scotia's manufacturers must foster innovation and adaptability to build and maintain their market share in North America and beyond. In a 2004 survey of its national membership, the Canadian Manufacturers & Exporters (CME) discovered that 57% of its member companies considered the appreciation of the Canadian dollar (in U.S. terms) to be their most pressing challenge. Nearly 40% of the survey respondents cited increasing competition from China and changing customer demands as relevant challenges, while 30% identified higher business costs as a significant challenge.²

Annual Average Exchange Rate,
Canadian Dollar to U.S. Dollar, 2001-2005

Year	Exchange Rate (US / CDN)	Annual % Change
2001	0.6456	
2002	0.6369	-1.35%
2003	0.7141	12.12%
2004	0.7686	7.63%
2005*	0.8200	6.70%

*Up to and including October 2005

Source: Bank of Canada

In 2004, the United States accounted for approximately 70% of Nova Scotia's manufacturing sector's total international exports. Furthermore, these manufacturing exports to the United States represented nearly 50% of Nova Scotia's total international exports in 2004. Clearly, the appreciation of the Canadian dollar (in U.S. terms) is creating continual challenges for the manufacturing sector in Nova Scotia – challenges that must clearly be met if the sector, and the Nova Scotia

economy as a whole, are to perform strongly in the months and years to come.

Business Conditions Survey

The Business Conditions Survey is administered quarterly by Statistics Canada. It reveals that, as of the third quarter of 2005, 92% of Nova Scotia's manufacturers believed that employment prospects were increasing or unchanged, compared to 76% as of the third quarter of 2004 and 80% as of the third quarter of 2003. Approximately 50% of Nova Scotia's manufacturers believed that their production prospects were higher as of the third quarter of 2005, compared to 29% as of the third quarter of 2004 and 27% as of the third quarter of 2003. In terms of orders received, 85% of Nova Scotia's manufacturers believed that orders received were rising or about right as of the third quarter of 2005, compared to 90% as of the third quarter of 2004 and 78% as of the third quarter of 2003. Collectively, it appears as though the province's manufacturers are displaying a relatively positive outlook on their business conditions in 2005 (see Table 16 in Appendix B).

Key Highlights of Nova Scotia's Manufacturing Sector in 2004-2005

- In 2004, chained (1997) GDP of the sector grew by 1.3% over 2003, reaching approximately \$2.2 billion. This growth rate matched that of the province's overall chained (1997) GDP.
- In 2004, manufacturing shipments increased by 7.4% over 2003, surpassing \$9 billion for the first time. In 2005, shipments are on pace to exceed \$9 billion once again, at an estimated \$7.4 billion as of September end.
- Total employment in the sector dropped by 2.9% in 2004 from 2003, despite a drop in the unemployment rate to 8.6% from 9.9%.
- In 2004, the sector's total international exports increased by 14.3% over 2003, with exports to the U.S. increasing by 7.1%. Total international imports increased by 10.1% in 2004, surpassing \$5.3 billion.

Economic Performance of the Manufacturing Sector

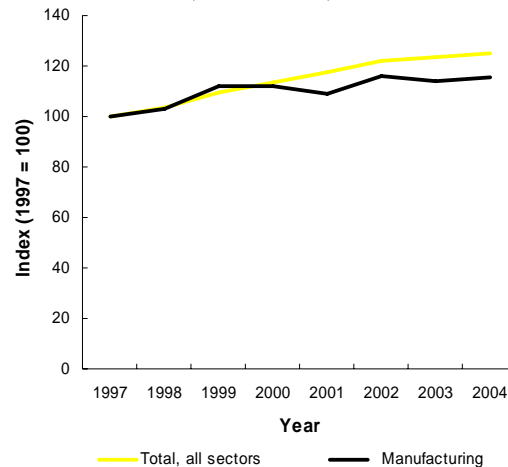

Gross Domestic Product (GDP)

Similar to many of the province's industrial sectors, Nova Scotia's manufacturing sector is highly dependent on the natural resources of the land and the sea. The province's resource-based manufacturing subsectors, including food manufacturing, wood product manufacturing, and paper manufacturing, have traditionally been vital to the overall economic performance of Nova Scotia's manufacturing sector. Nonetheless, sophisticated technological industries such as aerospace product and parts manufacturing are also contributing significant production outputs.

As illustrated in Figure 1, the chained gross domestic product (GDP)³ of Nova Scotia's manufacturing sector has been on the rise since 1997, with the exception of marginal declines in 2001 and 2003. During this period, overall growth in Nova Scotia's total chained GDP has been slightly stronger and less volatile than growth in the manufacturing sector. In 2003 and 2004, the sector accounted for approximately 9.6% of Nova Scotia's total chained GDP, down slightly from 9.9% in 2002 (see Figure 2).

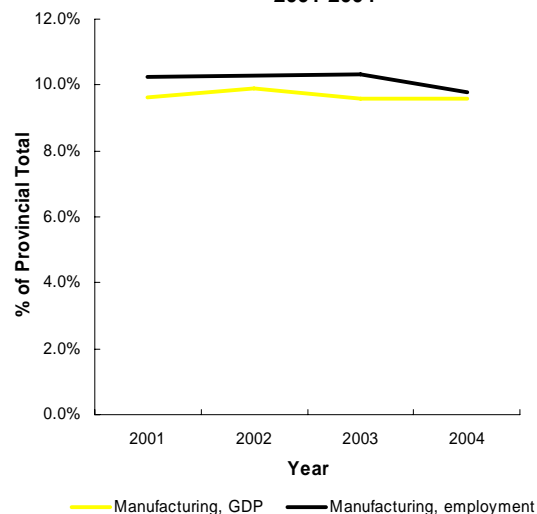

Although the publishable detail of GDP data is limited at the subsector and industry levels, there are a few insights that can be gained from the data in Table 1 (see Appendix B). Since 2001, the seafood product preparation and packaging industry has represented between 5.5% and 6.1% of Nova Scotia's total manufacturing chained GDP. For the same period, the wood products subsector accounted for about 6.8% of total manufacturing GDP, and the textile and textile product mills subsectors accounted for between 4.6% and 5.1% of

Figure 1: GDP Growth Index, Chained (1997) GDP, Nova Scotia, 1997-2004

Source: Table 1, Appendix B

Figure 2: Manufacturing as a % of Total Chained (1997) GDP and Total Employment, Nova Scotia, 2001-2004

Source: Tables 1 and 5, Appendix B

³ See Appendix B endnotes (Table 1) for a definition of chained GDP

Nova Scotia Manufacturing Profile 2001-2005

total manufacturing GDP. In 2001, the aerospace products and parts industry represented an impressive 7.7% of the province's total manufacturing GDP.

Manufacturing Subsectors and Industries as % of Total Manufacturing Sector GDP, Nova Scotia, Chained 1997 GDP

Subsector/ Industry	NAICS Code	2001	2002	2003	2004
Seafood products	3117	6.1%	5.9%	6.0%	5.5%
Wood products	321	6.6%	6.8%	6.6%	6.8%
Textile and textile product mills	313-314	5.1%	4.6%	5.3%	5.0%
Aerospace product and parts	3364	7.7%	-	-	-

Source: Table 1, Appendix B

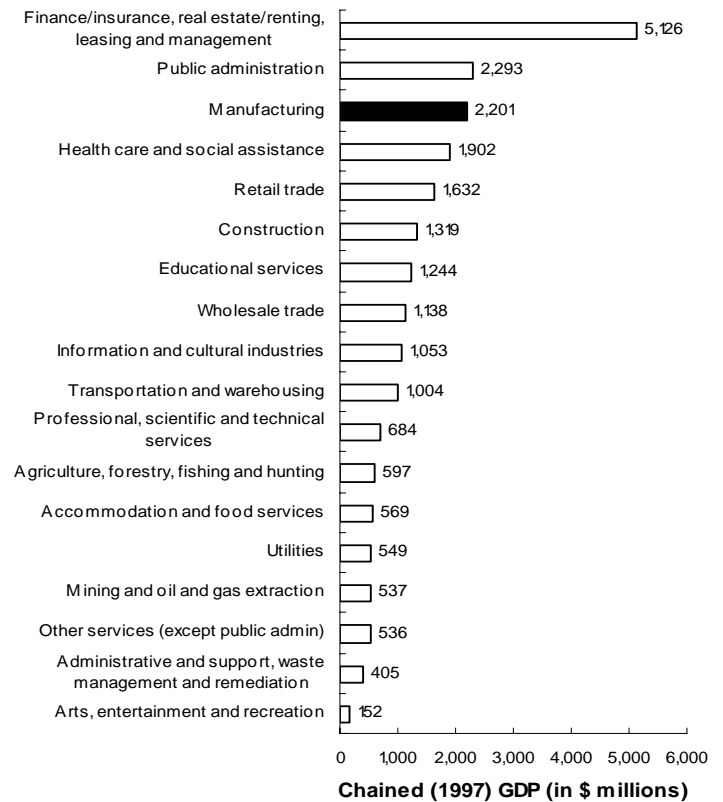

Between 2001 and 2004, Nova Scotia's manufacturing sector experienced an annual compound average growth rate (annual CAGR) of approximately 1.9%, compared to 2.2% for the province as a whole. The seafood product preparation and packaging industry exhibited an annual CAGR of -1.5% over this period, while the wood products and textile and textile product mills subsectors experienced an annual CAGR of 2.5% and 1.0% respectively.

Figure 3 highlights the important role that the manufacturing sector plays in the overall economic output of Nova Scotia. In 2004, the manufacturing sector produced over \$2.2 billion in chained GDP, up approximately 1.2% from 2003. This represented the third-largest output of any industrial sector in Nova Scotia. The public administration sector was marginally larger in terms of chained GDP, while the finance/insurance, real estate/renting, and leasing and management sector was easily the largest sector in the province.

In terms of chained GDP, manufacturing was the largest goods-producing sector in 2004, with output substantially exceeding that of the utilities sector, construction sector, mining and oil sector, and agriculture, forestry, fishing and hunting sector.⁴

The manufacturing sector also exhibited a higher GDP than most service-producing sectors, including health care and social assistance, retail trade, wholesale trade, and educational services.

Figure 3: Top Industrial Sectors by Chained (1997) GDP, Nova Scotia, 2004

Source: Table 1, Appendix B

⁴ See Appendix A for a list of goods-producing and service-producing sectors according to NAICS

Manufacturing Shipments

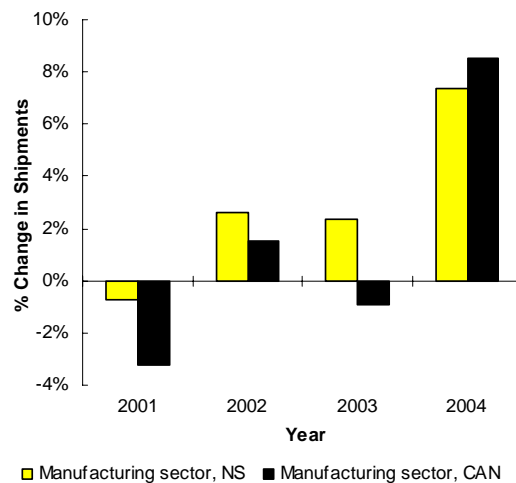

On a nominal-dollar basis, Nova Scotia's manufacturing shipments⁵ have been rising steadily since 2002, after a slight decline in 2001. The year 2004 was a particularly strong period for the province, with total manufacturing shipments topping \$9 billion for the first time ever. This led to a 7.4% increase in shipments over 2003, from approximately \$8.6 billion to \$9.3 billion (see Table 2). As demonstrated in Figure 4, Nova Scotia's manufacturing shipments have generally grown at a rate that meets or exceeds the Canadian manufacturing sector as a whole.

The strong growth in manufacturing shipments from 2002 to 2004 can be attributed to several manufacturing subsectors. Shipments in the food subsector increased by 2.5% in 2004, after a slight decline in 2003. Within this subsector, the meat products industry performed particularly well in 2004, while the seafood product preparation and packaging industry experienced lower shipments for the second consecutive year. The paper and transportation equipment subsectors also experienced notable growth in shipments in 2004, up 6.2% and 9.8% respectively. Within the transportation equipment subsector, the aerospace products and parts industry posted an impressive 15.7% increase in shipments after a weaker year in 2003.

However, the largest increase in shipments was experienced by the wood product subsector, which rebounded from a difficult 2003 to post a 20.4% gain in 2004. This gain was driven, in part, by the sawmills and wood preservation industry, which increased shipments by over 23% after a challenging year in 2003. Since most sawmill output is destined for the U.S., it will be interesting to see if this industry can withstand the appreciation of the Canadian dollar and perform equally well in the coming months.

⁵ See Appendix B endnotes (Table 2) for a definition of manufacturing shipments

Figure 4: Annual % Change in Manufacturing Shipments, Nova Scotia and Canada, 2001-2004

Source: Table 2, Appendix B

Growth Rates of Selected Manufacturing Subsectors and Industries, by Manufacturing Shipments, Nova Scotia, 2003-2004

	2003 % Change from 2002	2004 % Change from 2003
Total manufacturing sector	2.4%	7.4%
Non-durable goods manufacturing subsectors	3.4%	7.0%
Food	-0.7%	2.5%
Animal foods	-9.4%	-1.6%
Dairy products	-0.1%	5.5%
Meat products	-7.8%	19.6%
Seafood product preparation and packaging	-4.6%	-6.3%
Bakeries and tortilla	3.2%	15.6%
Paper	1.7%	6.2%
Durable goods manufacturing subsectors	-0.4%	8.4%
Wood products	-1.5%	20.4%
Sawmills and wood preservation	-6.6%	23.3%
Veneer, plywood and engineered wood products	7.8%	6.4%
Other wood products	18.8%	21.5%
Machinery	8.4%	2.5%
Transportation equipment	-10.6%	9.8%
Motor vehicle body and trailers	-	-
Aerospace product and parts	-7.8%	15.7%
Ship and boat building	-52.1%	2.6%

Source: Table 2, Appendix B

According to Statistics Canada, seafood product preparation and packaging, dairy, fruit and vegetable preserving, and sawmill output have traditionally accounted for the bulk of Nova Scotia's manufacturing shipments.⁶ This is evidenced by the data in Table 2. Between 2001 and 2004, the food subsector accounted for roughly 22% to 24% of Nova Scotia's total manufacturing shipments. Certainly, seafood and dairy products represent a substantial portion of these shipments: roughly 55% in 2004. The paper subsector accounted for 9.3% of shipments in 2004, down from a high of 11.7% in 2001. The transportation equipment subsector, driven primarily by the aerospace products and parts industry, represented approximately 8.4% to 9.4% of shipments during the period between 2001 and 2004. Another large producer of manufacturing shipments is the wood products subsector, which is led primarily by sawmills and wood preservation. In 2004, this subsector provided 7.0% of the province's total manufacturing shipments, up marginally from the 2003 figure of 6.3%.

Overall, as illustrated in Figure 6, these four manufacturing subsectors accounted for roughly half of the province's total manufacturing shipments between 2001 and 2004. This figure has dropped somewhat from 50.9% in 2001 to 46.9% in 2004.

If one examines the overall shipments of durable goods manufacturing subsectors versus non-durable goods manufacturing subsectors⁷, it is evident that non-durable goods represent the majority of shipments: roughly 74% in 2003 and in 2004. The variation in shipments between 2001 and 2004 tends to be similar for non-durable and durable goods, with coefficients of variation (CV) of 5.2% and 5.8% respectively.⁸

⁶ Statistics Canada, *Manufacturing in 2004: Year-end Review by Province*, Cat. No. 11-621-MIE – No. 025

⁷ See Appendix A for a listing of durable goods and non-durable goods manufacturing subsectors according to NAICS

⁸ CV = (Standard Deviation ÷ Mean) x 100%

Analysis of Capital Expenditures, Costs, and Labour Productivity

Since 2001, the Nova Scotia manufacturing sector has been experiencing a general decline in overall capital expenditures, which include investments in construction and machinery and equipment. Capital expenditures declined at an annual CAGR of -2.9% between 2001 and 2005, although expenditures have grown by 9.8% in 2005, primarily due to increased investment in construction activity.⁹ In contrast, capital expenditures in the overall Canadian manufacturing sector exhibited an annual CAGR of 2.8% between 2001 and 2005. Collectively, the Nova Scotia economy has also been experiencing growth in capital expenditures, with an annual CAGR of 3.6% between 2001 and 2005.

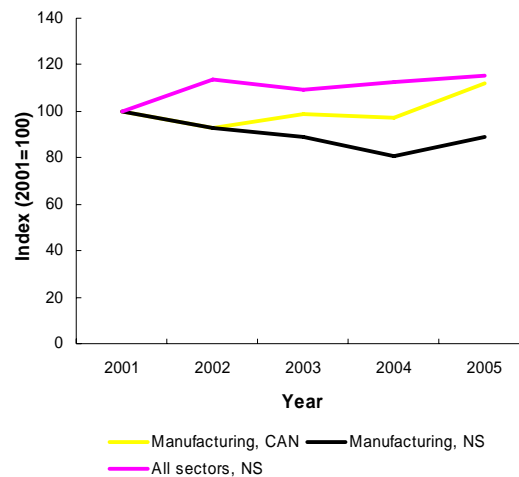

In Nova Scotia, the manufacturing sector has been allocating the majority of its capital expenditures to machinery and equipment. In 2005, 88% of capital expenditures were directed to investment in machinery and equipment, compared to a similar figure of 90% for the overall Canadian manufacturing sector.

Statistics Canada's Annual Survey of Manufacturing (ASM) provides some relevant information relating to costs and revenues of selected manufacturing subsectors in Nova Scotia (see Tables 4(a) and 4(b)). Upon analysis of the contribution margin (CM), which is essentially a percentage measure of operating profits before fixed costs, it is evident that manufacturers in Nova Scotia have been facing proportionately higher production costs in recent years.¹⁰

⁹ Capital and repair expenditures for 2004 and 2005 are based on preliminary actuals and intentions. See Table 3.

¹⁰ $CM = (\text{Value of Total Goods Sold \& Other Revenue} - \text{Cost of Total Materials \& Supplies} - \text{Total Salaries and Wages}) / \text{Value of Total Goods Sold \& Other Revenue}$ (note that this is not the "textbook" definition of contribution margin, since fixed and variable costs are not explicitly differentiated in the ASM)

Source: Tables 4(a) and 4(b), Appendix B

Nova Scotia Manufacturing Profile 2001-2005

Collectively, the province's manufacturing sector has seen its CM fall from 25.2% in 2001 to 22.2% in 2003. The paper subsector experienced one of the largest declines during this period, with a CM of 48.4% in 2001 slipping to 32.0% in 2003. In 2003, the textile mills subsector enjoyed the highest CM of any manufacturing subsector in Nova Scotia, with a CM of 45.8%. At 12.7%, the chemical subsector had the lowest CM among manufacturing subsectors in 2003.

No doubt, rising costs of fuel and electricity are partly responsible for decreases in CM over the 2001 to 2003 time frame, and these effects have likely been even more pronounced in 2004 and 2005.¹¹ The fuel & electricity ratio, which represents fuel and electricity costs as a percentage of total materials and supplies costs, has increased only slightly for the Nova Scotia manufacturing sector, from 4.7% in 2001 to 4.9% in 2003. However, this ratio reveals that the paper subsector, in particular, is highly susceptible to fluctuations in fuel and electricity prices. In 2003, the fuel & electricity ratio for this subsector was 35.4%, an increase of over 3% from 2001. On an absolute basis, the manufacturing sector's fuel and electricity costs have increased by nearly 16% in Nova Scotia between 2002 and 2003. The food subsector and the fabricated metal products subsector experienced the largest increases, in excess of 30%. In contrast, the plastics and rubber products subsector decreased fuel and electricity costs by 6.5% over this period.

Overall, between 2002 and 2003, the manufacturing sector experienced percentage increases in materials and supplies costs that considerably outweighed percentage increases in value of total goods sold and other revenue. Total materials and supplies costs increased by 16.5%, while value of total goods sold and other revenue increased by 8.6%. This contributed to an

overall decline in total "value-added" for the manufacturing sector in 2003.¹² A more detailed breakdown of cost and revenue growth rates by manufacturing subsector is provided below:

Growth Rates of Selected Costs and Revenues, Manufacturing Sector and Selected Manufacturing Subsectors, Nova Scotia, 2002-2003

	Salaries/ Employee	Fuel & Electricity	Cost of Total Materials and Supplies	Value of Total Goods Sold & Other Revenue
Food	-0.1%	30.0%	11.4%	8.7%
Wood products	7.2%	7.5%	-3.2%	-1.6%
Paper	7.7%	21.3%	17.6%	4.7%
Plastics and rubber products	1.5%	-6.5%	43.3%	25.8%
Fabricated metal products	10.9%	32.0%	-2.2%	-3.4%
Machinery	8.5%	10.3%	2.9%	5.1%
Computer and electronic products	2.6%	1.0%	0.4%	6.4%
Transportation equipment	6.4%	16.2%	-23.1%	-17.2%
Total manufacturing sector	1.9%	15.8%	16.5%	8.6%

Source: Tables 4(a) and 4(b), Appendix B

Labour productivity is an important performance measure in virtually every industrial sector, and the manufacturing sector is certainly no exception. There are a number of methodologies for gauging labour productivity, and each of them is subject to unique strengths and limitations. In the *Nova Scotia Manufacturing Profile*, ASM data is used to calculate labour productivity as "total value-added per employee", where employees are defined as the sum of production and non-production (i.e. administrative and non-manufacturing) workers. A similar approach using "census value-added per employee" to measure labour productivity has been adopted in various Statistics Canada papers.¹³

In general, labour productivity (as defined in the *Nova Scotia Manufacturing Profile*) can increase through increases in labour intensity (i.e. "employee

¹¹ Due to necessary time lags in disseminating the ASM, data for 2004 and 2005 was not available from Statistics Canada at the time of publication.

¹² See Appendix B endnotes (Table 4(b)) for a definition of "value-added". Although the measures are similar, "value-added" should not be confused with GDP.

¹³ See, for example, Statistics Canada, *Participation in export markets and productivity performance in Canadian manufacturing*, Cat. No. 11F0027MIE – No. 011

Nova Scotia Manufacturing Profile 2001-2005

hours per employee”) or improved labour efficiency (i.e. “total value-added per employee hour”). Labour efficiency is, itself, affected by two factors called capital productivity (i.e. “total value-added per capital investment dollar”) and capital deepening (i.e. “capital investment dollars per employee hour). The overall effect of each of the above factors on labour productivity can be expressed as follows:

Labour Productivity:	
=	$\frac{\text{Total Value-Added (\$,000)}}{\text{Employee}}$
=	Labour Efficiency x Labour Intensity
=	(Capital Productivity x Capital Deepening) x Labour Intensity

This formula demonstrates that labour productivity figures are directly influenced by capital investments, that is, investments in long-term assets such as machinery and equipment. ASM data, however, does not provide information relating to capital investments, nor does it provide detail on employee hours (i.e. total hours worked by employees). Thus, the various factors, or drivers, that influence labour productivity cannot be individually identified.¹⁴ This is one limitation of the data used to measure labour productivity in the *Nova Scotia Manufacturing Profile*. Nonetheless, the labour productivity measures reported herein should be of interest and of value, if one keeps in mind that the above-mentioned drivers are inherently at work.

Overall, between 2001 and 2003, the labour productivity of Nova Scotia’s manufacturing sector fell by 5%, from 84.8 in 2001 to 80.8 in 2003. The plastics and rubber products subsector exhibited solid labour productivity of 139.2 in 2003, up nearly 19% from 2002. Relatively speaking, Nova Scotia’s important food subsector displayed low labour

productivity of 49.7 in 2003, nearly 40% lower than the sector average that year. Labour productivity rates for other subsectors are provided below:

Labour Productivity, Manufacturing Sector and Selected Manufacturing Subsectors, Nova Scotia, 2001-2003

	2001	2002	2003
Food	52.4	50.7	49.7
Textile mills	-	-	127.5
Clothing	-	-	42.0
Wood products	58.7	72.8	71.9
Paper	211.1	138.3	114.3
Chemical	-	-	66.3
Plastics and rubber products	-	117.3	139.2
Non-metallic mineral products	-	-	84.5
Fabricated metal products		57.4	61.3
Machinery	74.9	76.2	81.7
Computer and electronic products	-	77.5	79.1
Transportation equipment	99.6	100.6	104.1
Total manufacturing sector	84.8	82.9	80.8

Source: Table 4(b), Appendix B

Correlation coefficients can be used to determine the strength of relationships between two variables.¹⁵ Between 2001 and 2003, the ASM data suggests that labour productivity is strongly *positively* correlated with capital and repair expenditures and is moderately *negatively* correlated with average establishment size:

Labour Productivity Correlation Coefficients, Manufacturing Sector, Nova Scotia, 2001-2003

	2001	2002	2003
Average Establishment Size (Employees per Establishment)	35.3	37.7	37.0
Capital/Repair Expenditures (\$,000,000)	781.7	747.0	746.8
Correlation Coefficient between: 2001-2003			
Labour Productivity and Average Establishment Size	-0.68		
Labour Productivity and Capital/Repair Expenditures	0.86		

Source: Tables 3 and 4(b), Appendix B

¹⁴ Capital expenditures from Statistics Canada’s Capital and Repair Expenditures Survey are confidential at the manufacturing subsector level. Also, employee hours at the manufacturing subsector level are confidential in the Input-Output system of Statistics Canada.

¹⁵ Correlation coefficients must be used with caution here, since they are only based on three years of data (2001-2003). However, they may give a rough idea as to the linear relationship between labour productivity and other factors. Note that a coefficient of -1 indicates the strongest possible negative relationship, while a coefficient of +1 indicates the strongest possible positive relationship.

Labour Force Characteristics of the Manufacturing Sector

Employment

The manufacturing sector is a vital source of employment in rural and urban Nova Scotia alike. Between 2001 and 2004, the sector employed an average of 43.5 thousand workers aged 15 years and over (see Table 5). This represented nearly half (approximately 47.7%) of the average total employment in all goods-producing sectors and over 10% (approximately 10.2%) of the average total employment in all sectors in Nova Scotia over the same four-year period (see Figure 2). In addition, the manufacturing sector employs significantly more full-time workers, on a percentage basis, than the provincial average. In 2004, only 6.0% of all manufacturing workers aged 15 years and over were employed on a part-time basis, compared to the provincial average of 18.8%.

As illustrated in Figure 8, total employment in Nova Scotia's manufacturing sector has been growing at a rate that generally meets or exceeds that of the overall Canadian manufacturing sector and the overall Nova Scotia economy. In 2003, the manufacturing sector added roughly 1,100 jobs in Nova Scotia to boost its employment figures by 2.5%. The year 2004 saw a drop in employment of 2.9%, despite a slight increase in part-time employment in the sector.

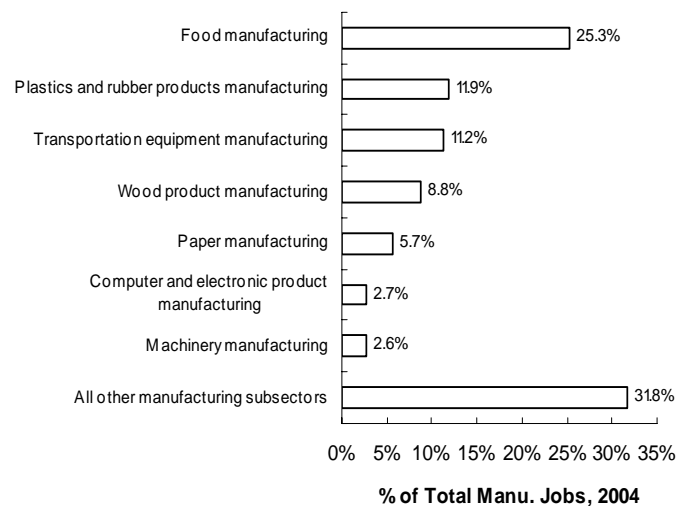

In recent years, the food subsector has accounted for about one quarter of all manufacturing jobs in the province, which equates to roughly 10,000 workers per year between 2001 and 2004. In 2004, the plastics and rubber products subsector and the transportation equipment subsector each represented over 11% of manufacturing employment, while the wood products subsector accounted for nearly 9%.

Source: Table 5, Appendix B

Figure 9: Employment in Manufacturing Subsectors as a % of Total Manufacturing Employment, Nova Scotia, 2004

Source: Table 6, Appendix B

Nova Scotia Manufacturing Profile 2001-2005

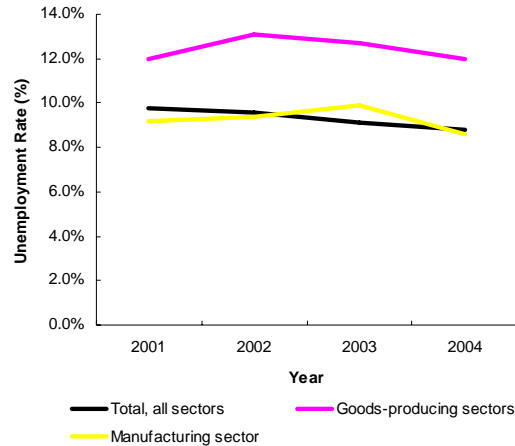

The most recent data from the Annual Survey of Manufacturers suggests that, in 2003, approximately 80% of all manufacturing workers were production workers. The remaining 20% worked in administrative or non-manufacturing roles.

Despite a decrease in total manufacturing jobs in 2004, the Nova Scotia manufacturing sector experienced a drop in its unemployment rate that year. This was due to a decline in the overall manufacturing labour force by approximately 2,000. Since 2001, the province's manufacturing sector has exhibited unemployment rates that generally align with the provincial unemployment rate. Notably, the collective unemployment rate of all goods-producing sectors in Nova Scotia is substantially higher than that of the manufacturing sector. In 2004, goods-producing sectors exhibited an unemployment rate of 12.0%, compared to a rate of 8.6% for the manufacturing sector.

Salaries, Wages, and Hours

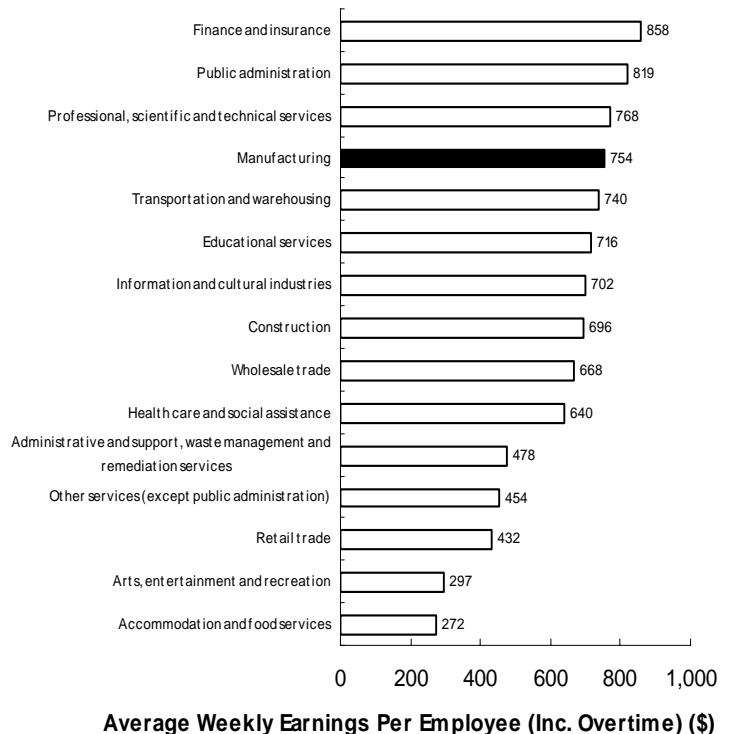

Statistics Canada's Survey of Employment, Payroll, and Hours (SEPH) indicates that Nova Scotia's manufacturing sector is one of the highest paying sectors in the province. Between 2001 and 2004, the average nominal weekly earnings per employee (including overtime) of the manufacturing sector experienced an annual CAGR of 2.6%, compared to 2.3% for the province as a whole. With reference to Figure 11, it is evident that the average manufacturing employee in Nova Scotia earned relatively high wages and salaries, with average weekly earnings of over \$750 in 2004. Note that these figures represent gross earnings, before tax and other applicable deductions. On average, between 2001 and 2004, employees in the manufacturing sector received weekly earnings that were 12.6% higher than the average across all Nova Scotia sectors. More detail regarding the *annual* average earnings per manufacturing employee, broken down by subsector, can be found in Table 6.

Nova Scotia Manufacturing Profile 2001-2005

Durable goods manufacturing subsectors, which provided 41.4% of all Nova Scotia manufacturing jobs in 2004, tend to pay higher wages than non-durable goods manufacturing subsectors. On average, between 2001 and 2004, employees in durable goods received 8.0% higher weekly earnings than their counterparts in non-durable goods. Within the durable goods subsectors, the transportation equipment subsector is one of the highest-paying, with average weekly earnings of approximately \$991 in 2004. This figure is over 25% higher than the average for all durable goods subsectors in 2004. Within the non-durable goods subsectors, the paper subsector is one of the highest-paying, with average weekly earnings of approximately \$992 in 2004. This figure is over 35% higher than the average for all non-durable goods subsectors in 2004.

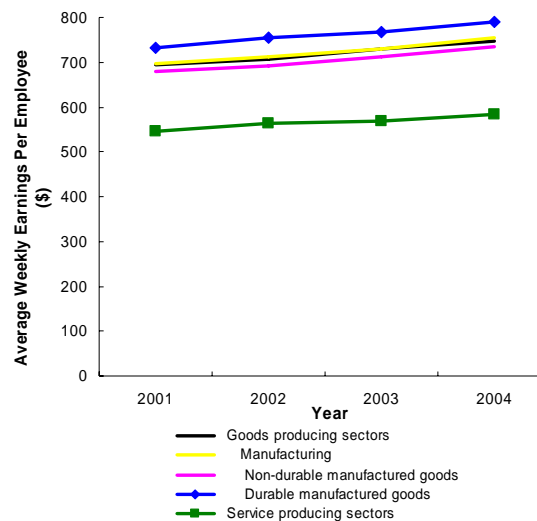

Employees in the manufacturing sector tend to work longer hours than the provincial average, with annual average hours per worker nearing 1,900 in 2004. Nonetheless, this figure has been declining since 2001, with an annual CAGR of -1.4% between 2001 and 2004 (see Figure 13). More detail is provided below:

Annual Average Number of Hours Worked Per Employee (for all jobs), Manufacturing Sector and Selected Subsectors, Nova Scotia, 2001-2004

Sector/Subsector	2001	2002	2003	2004
Total, all sectors	1,770	1,745	1,733	1,714
Total manufacturing sector	1,969	1,948	1,920	1,887
Computer and electronic products	-	2,047	1,945	2,198
Wood products	2,132	2,099	2,096	2,004
Machinery	1,882	2,022	1,907	1,976
Plastics and rubber products	1,966	1,959	1,912	1,957
Paper	2,052	1,884	1,892	1,954
Transportation equipment	2,029	1,942	1,936	1,916
Food	1,878	1,919	1,876	1,772
Textile and textile product mills	1,898	1,924	1,777	-

Trade in Manufactured Goods

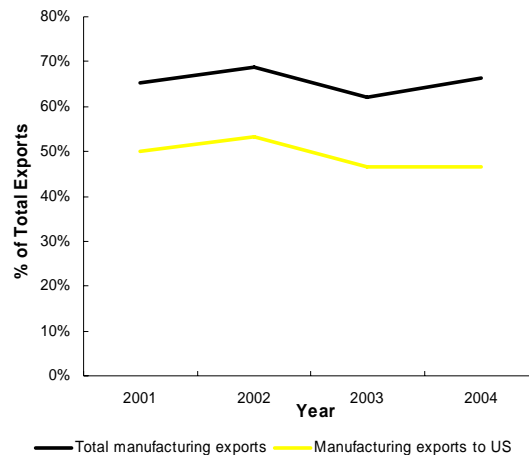

International Trade

Since 2001, the manufacturing sector has consistently been producing more than 60% of the province's total international exports.¹⁶ This percentage rose by 4% to 66% in 2004, after falling by 7% in 2003. On an absolute basis, total international exports of the manufacturing sector experienced a modest annual CAGR of approximately 1% between 2001 and 2004, although the year 2004 saw an impressive 14.3% increase over 2003.

Certainly, the majority of the manufacturing sector's total international exports are destined for the United States. In 2004, 70% of the manufacturing sector's total international exports went to the United States, with 65% of these exports destined for the New England, Mid-Atlantic, and Southern states (see Figure 16 on the following page). In fact, in 2004, the manufacturing sector's total international exports to the United States represented nearly 50% of the provincial economy's total international exports (see Figure 14).

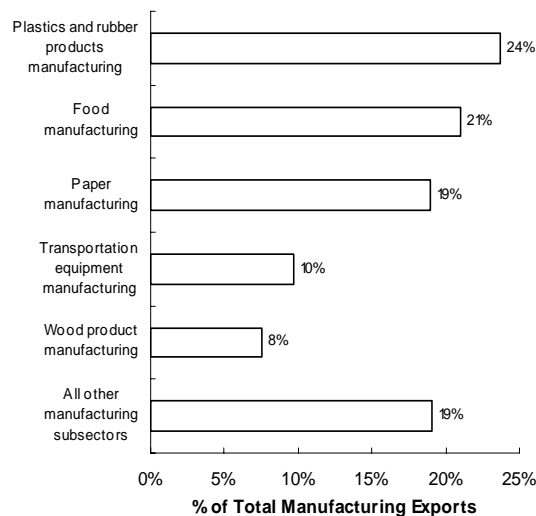

Looking at the subsector level, the plastic and rubber products subsector accounted for nearly one quarter of the manufacturing sector's total international exports in 2004. As illustrated in Figure 15, the food, paper, transportation equipment, and wood product subsectors also accounted for significant portions of total international exports. Not surprisingly, these subsectors also accounted for a considerable share of the province's total manufacturing shipments in 2004.

Figure 14: Manufacturing Exports as a % of Total Exports, Nova Scotia, 2001-2004

Source: Tables 8 and 12, Appendix B

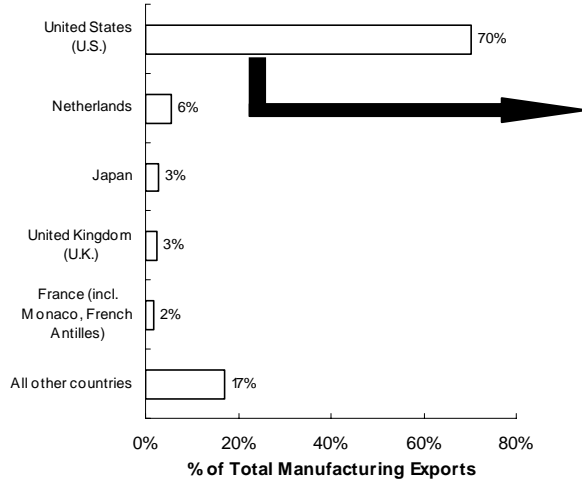

Figure 15: Top 5 Exporting Manufacturing Subsectors, Nova Scotia, 2004

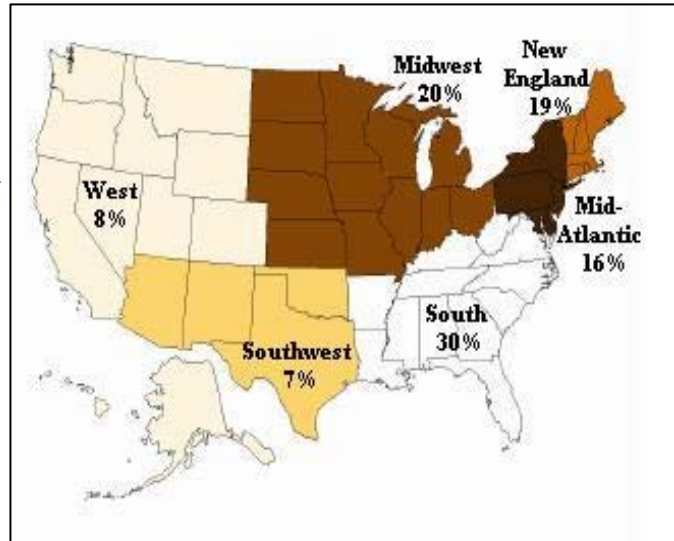

Source: Table 8, Appendix B

¹⁶ Total international exports are recorded by province of origin. For a definition of total international exports and province of origin, see Appendix B endnotes (Table 8).

Figure 16: Top 5 Destinations of Manufacturing Exports, Nova Scotia, 2004

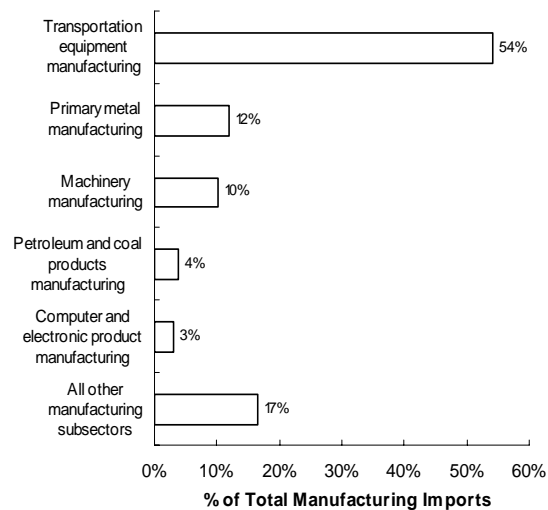

Source: Table 12, Appendix B

Source: Table 10, Appendix B
Map image courtesy of BC Stats

Total international imports of the manufacturing sector have been on the rise since 2001, with an annual CAGR of 6.3% between 2001 and 2004.¹⁷ In 2004, the manufacturing sector's total international imports increased by 10.1%. In recent years, the origins of the manufacturing sector's total international imports have been more diverse than the destinations of the sector's total international exports. While total international exports were primarily destined for the United States in 2004, total international imports were received in relatively equal proportion from several countries. Germany was the primary country of origin, having accounted for over 30% of the manufacturing sector's total international imports in 2004. Cuba, the United Kingdom, and the United States contributed between 6% and 11% of total international imports for the sector in 2004, while several other nations contributed upwards of 5%.

Figure 17: Top 5 Importing Manufacturing Subsectors, Nova Scotia, 2004

Source: Table 9, Appendix B

¹⁷ Total international imports are recorded by province of clearance. For a definition of total international imports and province of clearance, see Appendix B endnotes (Table 9).

Nova Scotia Manufacturing Profile 2001-2005

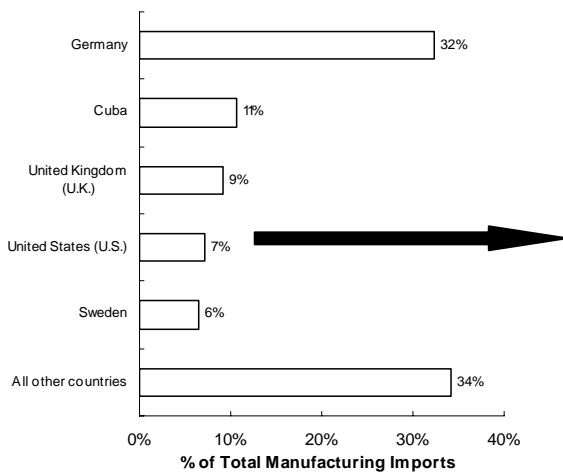

In 2004, nearly 65% of the manufacturing sector's imports from the United States came from the Midwest, Southwest, and Western states. This contrasts with the sector's exports to the United States, where 65% were sent to the county's eastern states in 2004.

Note: When considering these statistics on total international imports, one must bear in mind that total international imports are recorded by province of clearance. Therefore, these imports did not necessarily remain in the province of Nova Scotia; rather, Nova Scotia was simply the province where the import physically crossed or "cleared" the international border into Canada.

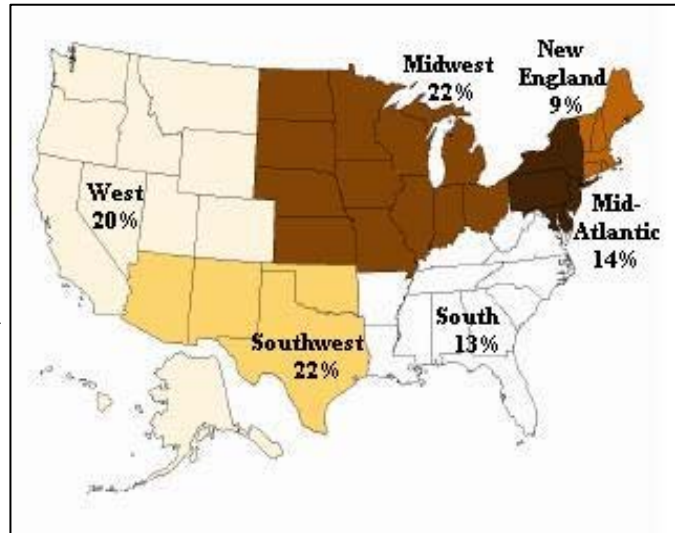

The transportation equipment subsector was the manufacturing sector's largest importer in 2004, accounting for 54% of the sector's total international imports. The primary metal subsector and the machinery subsector comprised 12% and 10% of imports, respectively (see Figure 17).

For more detail regarding international trade in Nova Scotia's manufacturing sector, see Tables 8 to 14 in Appendix B.

Inter-Provincial Trade

Inter-provincial trade data, while unavailable according to NAICS codes, can be obtained according to the type of manufactured good.¹⁸ In 2002, Nova Scotia's inter-provincial imports of manufactured goods¹⁹ increased to approximately \$4.25 million, a 3.2% gain over 2001. In terms of manufactured goods, the most prominent inter-provincial imports were chemicals, pharmaceuticals, and chemical products, along with meat, fish, and dairy products. These two groups of products each represented approximately 12% of the province's inter-provincial imports of manufactured goods in 2002. Nonetheless, as illustrated in Figure 19, inter-provincial imports of manufactured goods tended to be quite diverse in 2002, with no single product group dominating the import activity.

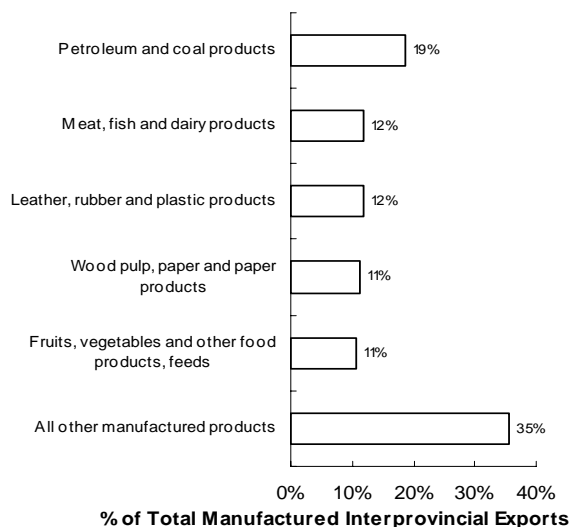

Nova Scotia's inter-provincial exports of manufactured goods increased to approximately \$3.1 million in 2002, a gain of 8.9% over 2001. In 2002, petroleum and coal products represented 19% of the province's inter-provincial exports of manufactured goods, down slightly from 21% in 2001. On an absolute basis, inter-provincial exports of petroleum and coal products declined by nearly 3% between 2001 and 2002. Meat, fish, and dairy products and leather, rubber, and plastic products collectively accounted for nearly one quarter of Nova Scotia's inter-provincial exports of manufactured products in 2002. Approximately 31% of the province's inter-provincial exports of manufactured goods were destined for Ontario in 2002, while 20% went to Quebec and 16% went to New Brunswick (see Table 15 in Appendix B).

Figure 19: Top 5 Manufactured Inter-Provincial Imports, Nova Scotia, 2002

Source: Table 15, Appendix B

Figure 20: Top 5 Manufactured Inter-Provincial Exports, Nova Scotia, 2002

Source: Table 15, Appendix B

¹⁸ Data for 2003 to 2005 was unavailable at the time of publication

¹⁹ In this section, totals for manufactured goods exclude primary metal products, tobacco, and tobacco products, as data for these products is confidential or not available.

Appendix A

NAICS Sectors

The North American Industry Classification System (NAICS), which was preceded by the Standard Industrial Classification (SIC), was jointly adopted in 1997 by Canada, the United States, and Mexico against the backdrop of NAFTA. The classification system was implemented to provide standard definitions of the industrial structures of the three countries and a common statistical framework to facilitate the analysis of the three economies. The structure of NAICS is revised every five years, to ensure the dynamics of the Canadian, American, and Mexican economies are properly reflected by the classification system.

According to the latest revision of NAICS in 2002, the Canadian economy is classified into the following 20 sectors:

NAICS Code	Sector
11	Agriculture, Forestry, Fishing and Hunting
21	Mining and Oil and Gas Extraction
22	Utilities
23	Construction
31-33	Manufacturing
41	Wholesale Trade
44-45	Retail Trade
48-49	Transportation and Warehousing
51	Information and Cultural Industries
52	Finance and Insurance
53	Real Estate and Rental and Leasing
54	Professional, Scientific and Technical Services
55	Management of Companies and Enterprises
56	Administrative and Support, Waste Management and Remediation Services
61	Educational Services
62	Health Care and Social Assistance
71	Arts, Entertainment and Recreation
72	Accommodation and Food Services
81	Other Services - except Public Administration
91	Public Administration

Note: On occasion, Statistics Canada releases data in a format that aggregates two or more NAICS sectors, subsectors, or industries. When applicable, these aggregated groupings are described in the endnotes to the appropriate tables in Appendix B.

The Manufacturing Sector by Subsectors

The manufacturing sector (NAICS 31-33), which is the focus of this publication, is further classified into 21 subsectors:

NAICS Code	Subsector
311	Food Manufacturing
312	Beverage and Tobacco Product Manufacturing
313	Textile Mills
314	Textile Product Mills
315	Clothing Manufacturing
316	Leather and Allied Product Manufacturing
321	Wood Product Manufacturing
322	Paper Manufacturing
323	Printing and Related Support Activities
324	Petroleum and Coal Products Manufacturing
325	Chemical Manufacturing
326	Plastics and Rubber Products Manufacturing
327	Non-Metallic Mineral Product Manufacturing
331	Primary Metal Manufacturing
332	Fabricated Metal Product Manufacturing
333	Machinery Manufacturing
334	Computer and Electronic Product Manufacturing
335	Electrical Equipment, Appliance and Component Manufacturing
336	Transportation Equipment Manufacturing
337	Furniture and Related Product Manufacturing
339	Miscellaneous Manufacturing

These manufacturing subsectors are subsequently broken down by *industry* (or, more precisely, industry groups) at the four-digit NAICS level. For more information on these four-digit codes, or other information pertaining to NAICS 2002, visit the Statistics Canada website (www.statcan.ca).

Goods-Producing Sectors and Service-Producing Sectors

The sectors of the Canadian economy can be categorized according to the nature of their output: goods or services. The following NAICS sectors are classified as *goods-producing* sectors, since they primarily produce tangible goods that are consumed by individuals or used as inputs by other producers:

NAICS Code	Sector
11	Agriculture, Forestry, Fishing and Hunting
21	Mining and Oil and Gas Extraction
22	Utilities
23	Construction
31-33	Manufacturing

The following NAICS sectors are classified as *service-producing* sectors, since they are primarily engaged in the provision of services:

NAICS Code	Sector
41	Wholesale Trade
44-45	Retail Trade
48-49	Transportation and Warehousing
51	Information and Cultural Industries
52	Finance and Insurance
53	Real Estate and Rental and Leasing
54	Professional, Scientific and Technical Services
55	Management of Companies and Enterprises
56	Administrative and Support, Waste Management and Remediation Services
61	Educational Services
62	Health Care and Social Assistance
71	Arts, Entertainment and Recreation
72	Accommodation and Food Services
81	Other Services - except Public Administration
91	Public Administration

Durable Goods Manufacturing Subsectors and Non-Durable Goods Manufacturing Subsectors

Within the manufacturing sector (NAICS 31-33), Statistics Canada distinguishes between durable goods manufacturing subsectors and non-durable goods manufacturing subsectors. According to Statistics Canada, the distinction between durable and non-durable goods can be described as follows:

“...the distinction between durable and non-durable goods is not based on physical durability as such. Instead, the distinction is based on whether the goods can be used once only for purposes of production or consumption or whether they can be used repeatedly, or continuously. For example, coal is a highly durable good in a physical sense, but it can be burnt only once. A durable good is therefore defined as one which may be used repeatedly or continuously over a period of more than one year, assuming a normal or average rate of physical usage...A qualifier that is sometimes added with respect to this ‘one year’ criterion is that the goods in question must also retain a considerable part of their original value after the one year time period. Clothing, for example, although generally reusable for more than one year, retains very little of its resale value after that time, and, hence, is treated as non-durable...The durable manufacturing industries comprise the more cyclically-sensitive portion of the manufacturing sector.”²⁰

The following is a breakdown of the durable goods and non-durable goods manufacturing subsectors, according to NAICS:

NAICS Code	Durable Goods
321	Wood Product Manufacturing
327	Non-Metallic Mineral Product Manufacturing
331	Primary Metal Manufacturing
332	Fabricated Metal Product Manufacturing
333	Machinery Manufacturing
334	Computer and Electronic Product Manufacturing
335	Electrical Equipment, Appliance and Component Manufacturing
336	Transportation Equipment Manufacturing
337	Furniture and Related Product Manufacturing
339	Miscellaneous Manufacturing
Non-Durable Goods	
311	Food Manufacturing
312	Beverage and Tobacco Product Manufacturing
313	Textile Mills
314	Textile Product Mills
315	Clothing Manufacturing
316	Leather and Allied Product Manufacturing
322	Paper Manufacturing
323	Printing and Related Support Activities
324	Petroleum and Coal Products Manufacturing
325	Chemical Manufacturing
326	Plastics and Rubber Products Manufacturing

Notes:
¹See Appendix B Endnotes (Table 16)

Appendix B Endnotes

These endnotes are intended to provide general definitions of terminology used in Tables 1 to 16, as well as to clarify various ambiguities that may appear in the tables. For more detailed information about the data sources, data collection methods, and statistical methodologies underlying these tables, refer to the Statistics Canada website (www.statcan.ca) or the Strategis website (strategis.ic.gc.ca). In particular, the footnotes to the appropriate CANSIM tables will be useful and can be found at cansim2.statcan.ca.

Table 1

¹*GDP by Industry* figures are expressed in chained (1997) dollars. Chaining is a methodology used by Statistics Canada to account for fluctuations in price which will occur over time. Furthermore, chaining preserves the original growth rates within sectors and industries of the economy. The chaining process is based on an index called the Chain Fisher Index. For the GDP data in Table 1, the base period for the Chain Fisher Index is 1997. Note that, for chained data, aggregates are not equal to the sum of their components (i.e. additivity is not preserved when the Chain Fisher Index is used).

Table 1 expresses GDP in *basic* prices, which are defined as follows by Statistics Canada: “the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer”. One must bear in mind that there are other ways of expressing GDP than presented here: *expenditure-based and income-based* rather than *by industry*; at *factor cost and market prices* rather than at *basic prices*; and in *constant dollars or nominal dollars* as opposed to *chained dollars*. As a result, caution is recommended when comparing the GDP data presented in the *Nova Scotia Manufacturing Profile* with other published sources.

Table 2

¹*Manufacturing shipments* are defined as follows by Statistics Canada:

The value of manufacturing shipments represents the net selling value of goods made by the reporting establishments.

This includes:

- transfers to other establishments of the same company
- the value of non-returnable containers
- the book value of goods produced and shipped for the first time on a rental basis
- shipments on consignment to other countries (provided these are already sold)

This excludes:

- discounts
- returned sales
- sales allowances
- sales tax
- excise taxes and duties
- the value of returnable containers
- common or contract carriers' charges for outward transportation

Table 3

¹*Capital expenditures* are defined as follows by Statistics Canada:

Capital expenditures are the gross expenditures on fixed assets for use in the operation of an establishment or lease or rent to others.

Included are:

- cost of all building and engineering construction and machinery and equipment which normally have a life of more than one year and are charged to fixed assets accounts
- modifications, additions, and major renovations
- capital costs such as feasibility studies and architectural, legal, installation, or engineering fees
- subsidies

Nova Scotia Manufacturing Profile 2001-2005

- capitalized interest charges on loans with which capital projects are financed
- work done by an establishment's own labour force
- additions to work in progress

Assets acquired for lease to others are included, but assets acquired as a lessee are not.

For more detail regarding the definitions of building and engineering construction and machinery and equipment, see the Statistics Canada website (www.statcan.ca).

Table 4(a)

¹Some major conceptual and methodological changes were made to the *Annual Survey of Manufactures (ASM)* beginning in the reference year 2000. Beginning in 2000, data for the Head Offices of manufacturers are no longer included, which affects the following variables: administration employees, total employees, salaries and wages, cost of materials, supplies and goods for resale, value of shipments, and other revenue and total value added. This change, amongst others, creates the need for caution when comparing the 2000-2003 data to pre-2000 data. The ASM data presented in Tables 4(a) and 4(b) provides financial statistics for *principal establishments*: that is, incorporated manufacturing businesses that have employees and sales of manufactured goods (i.e. value of goods sold) greater than or equal to \$30,000. Generally, an *establishment* corresponds to a plant, mill, or factory. However, the establishment may comprise more than one plant if accounting records do not permit separate reports for each one. An establishment may also include ancillary or support units, such as sales offices or warehouses. Consult the Statistics Canada website (www.statcan.ca) for a more detailed distinction between the four statistical units in business surveys: establishments, enterprises, companies, and locations.

²According to Statistics Canada, *manufacturing activity* consists of operations such as:

- processing and assembling
- storing, handling, packing, warehousing, etc.
- inspecting (including quality control)
- maintenance, repair, janitorial and watchman services
- erecting or installation for customers when such work is carried out as an extension of manufacturing operations and does not constitute a separate establishment
- working foremen doing work similar to that of employees they supervise

Production workers include all employees working directly in *manufacturing activity*.

The *cost of fuel and electricity* is defined as the cost of purchased energy, water utility expenses, and electricity consumed *for energy purposes only*, both in manufacturing and non-manufacturing operations. This covers amounts used in all vehicles, plant and office operations, and any support units which are part of the establishment. Any fuel purchased as an input into the manufacturing process as a feedstock or processing material (e.g. crude oil processed into gasoline) or for other non-energy purposes is excluded.

The *cost of materials and supplies* is defined as follows:

The total cost of all *manufacturing inputs* purchased, owned and used in manufacturing operations. Only commodity items or physical goods are reported and not costs of services or overhead charges. The cost of materials and supplies includes:

- purchases of raw materials and components (including any fuel used for non-energy purposes)
- containers and shipping materials
- cost of supplies used to operate, maintain, and repair buildings and equipment
- amount paid to other business units for work done on materials owned

Value of Goods Sold in the ASM will not be identical to *Manufacturing Shipments* in the *Monthly Survey of Manufacturing (MSM)* (see notes to Table 2), since the MSM and the ASM are administered independently by Statistics Canada.

Value-added is a measure of net output, that is, of gross output less those purchased inputs that have been embodied in the value of the product. *Manufacturing value-added* consists of value of goods sold plus net change in inventory of goods in process and finished goods, less cost of purchased inputs (which equals the cost of materials and supplies used and the cost of fuel and electricity) for manufacturing activities.

³*Administrative and non-manufacturing employees* include all employees designated as executive, administrative, clerical/office, and sales staff. Also included are employees on the payroll of the establishment and engaged in such non-manufacturing activities as: cafeterias or restaurant counters operated by the establishment; new construction, major repairs or alterations of buildings, machinery and equipment for the use of the establishment, when such work is chargeable to the fixed assets accounts.

Table 4(b)

¹*Total activity* includes the manufacturing and non-manufacturing activity of establishments. *Other revenues* represent the revenues from these non-manufacturing activities:

- sales of goods purchased for resale (in same condition as purchased)
- revenues from the rental or lease of manufactured products, machinery and equipment, and real property
- revenues from operations performed by their own labour force
 - service revenues
 - commissions on sales
 - revenues from contracted shipping
 - operation of cafeterias
 - outside installation or construction not related to own products
 - sale of used materials
 - research and development
- royalties and franchise fees

Total employees accounts for all personnel, both manufacturing and non-manufacturing/administrative, on the payroll of the establishment, including those working in ancillary units which form part of the establishment. *Total salaries and wages* are gross, before any deductions from employees for income tax and employee contributions for sickness, accident, pension, insurance, or other benefits. Fringe benefit contributions by the employer are not included. Included are overtime payments, vacation pay, directors' pay, bonuses, commission, taxable allowances, retroactive pay, and other allowances forming part of the employees' earnings.

Total value of goods sold & other revenues consists of the value of goods sold plus other revenues derived from non-manufacturing activity.

Table 5

¹LFS estimates at the sector and subsector levels, particularly for small provinces like Nova Scotia, may be based on small sample sizes. Thus, at this level of detail, the estimates may not be as accurate as they would be at the national level. Definitions of the LFS statistics in Table 5 can be found at cansim2.statcan.ca.

Table 6

¹Data by industry included in Table 6 correspond to the Canadian National Accounts' input-output M and S levels of aggregation. For concepts, methods, sources, and details concerning the industry classification system, see *Productivity Growth in Canada*, catalogue 15-204 XPE at www.statcan.ca. Definitions of the labour statistics in Table 6 can be found at cansim2.statcan.ca.

Tables 7(a) and 7(b)

¹According to Statistics Canada, the Survey of Employment, Payroll, and Hours (SEPH) is Canada's only source of detailed information on the total number of paid employees, payrolls, and hours at detailed industrial, provincial, and territorial levels. It reports *average weekly earnings* based on weekly payroll data, which includes gross pay as well as overtime, bonuses, commissions, and other special payments. The SEPH data excludes major payroll deductions such as income taxes or employee contributions to social insurance plans. The data also excludes taxable allowances and benefits (i.e. health, life insurance, etc.). The *standard work week* figures derived from SEPH are applicable only to *salaried* employees, not to

workers who are paid hourly wages (i.e. not on salary). For more information on SEPH, see the Statistics Canada website (www.statcan.ca).

Tables 8 to 14

¹According to Statistics Canada, *total international exports* include all goods leaving the country (through customs) for a foreign destination. It consists of the sum of *domestic exports* and *re-exports*:

$$\text{TOTAL INTERNATIONAL EXPORTS} = \text{DOMESTIC EXPORTS} + \text{RE-EXPORTS}$$

Domestic exports are exports of all goods grown, produced, extracted, or manufactured in Canada (specifically, Nova Scotia in this case) leaving the country through customs for a foreign destination. Exports of imported merchandise which has been substantially enhanced in value are also included. In contrast, *re-exports* refer to the export of goods that have previously entered Canada (specifically, Nova Scotia in this case) and are leaving in the same condition as when first imported. Exports of imported merchandise which has been minimally processed but *not* substantially enhanced in value are also counted as re-exports. It must be emphasized that the Strategis data for total international exports is listed by *province of origin*. *Province of origin* denotes the province in which the good was extracted, manufactured, or grown. Thus, if a product was manufactured in Nova Scotia, but left the country in the same condition through Ontario, for example, it would still be considered an international export from Nova Scotia.

²According to Statistics Canada, *total international imports* include all goods which have entered Canada (specifically, Nova Scotia in this case) by crossing territorial (i.e. customs) boundaries, whether for immediate domestic consumption or for storage in customs-bonded warehouses. This includes *re-imports*, which are defined as goods re-entering Canada (specifically, Nova Scotia in this case) after having been exported abroad without having been *materially altered or substantially enhanced in value* while abroad. It must be emphasized that the Strategis data for total international imports is listed by *province of clearance*. *Province of clearance* represents the province where the border (i.e. customs) crossing took place and the good physically crossed or "cleared" the border into Canada.

For more information on the international trade statistics in Tables 8 to 14, visit *Trade Data Online* or *Canadian Industry Statistics* at the Strategis website (strategis.ic.gc.ca). For a comprehensive discussion of trade in Nova Scotia, refer to the latest edition of *Nova Scotia Trade*, a publication of the Nova Scotia Department of Finance, Economics & Statistics Division (www.gov.ns.ca/finance).

Table 15

¹Total supply is defined as the value of production plus shipments out of the inventories of producers, wholesalers, and retailers. In each province and for each commodity, total supply is identical to sales to the rest of the world (international exports), to other Canadian provinces and territories (inter-provincial exports), and within province (self-supply).

²Inter-provincial exports equal the sum of the supply to each Canadian province and territory minus self-supply (i.e. supply to Nova Scotia).

Table 16

¹For details regarding the Business Conditions Survey, see *Definitions, data sources, and methods: Business Conditions Survey for the Manufacturing Industries* (www.statcan.ca).
