## ***Introduction***

The Alberta Costing Partnership has successfully developed patient specific case costs for both inpatient and ambulatory care, for the sixth consecutive year. The partnership consists of six costing regions along with the department of Alberta Health and Wellness.

The 2004 Annual Report discloses the cost of cases that were handled by the participating health regions between April 1, 2002 and March 31, 2003. Cases are grouped by linking to activity data to provide appropriate summary information.

The process of costing health services in Alberta is evolving, as is the reporting of costs. Once again the inpatient costs are reported by Case Mix Groups (CMGs). Since this format enhances age and complexity level reporting for case mix groups, readers can better grasp the role that complexity and age have on health care costs. The ambulatory care costs are reported by Ambulatory Care Classification System (ACCS).

The 2004 cost schedules were designed to meet the needs of various users. Direct and indirect cost components are provided in schedules 1 and 4. Schedules 2 and 5 provide information on cost trends and schedules 3 and 6 provide statistical data to assist users in assessing the accuracy and relevance of the cost data. Readers are encouraged to refer to the definitions of column headings on page 21.

As costing processes improve and more information becomes available, additional component details will be included in future reports.

The major driver behind health costing in Alberta continues to be its use in the calculation of each health region's funding. However, there is an increasing demand for cost information from users in the department, health authorities, and external users.

It should be noted that the cost information contained in this publication does not represent the provincial average cost of hospital-based services across the regional health authorities. Rather it reflects the average cost derived from the data submitted by only three health authorities for 16 different sites. The costs from these sites reflect 56 per cent of the provincial level of hospital-based inpatient activity (separations) and 31 per cent of the ambulatory care activity (visits). Although the data submitted have gone through reasonability validation, the Alberta Costing Partnership provides no external assurance over the appropriateness and completeness of cost allocations done by the health authorities.

Outside Alberta, significant interest has been expressed in the work done by the Alberta Costing Partnership, with numerous inquiries received from national bodies, other provincial health ministries, researchers, universities,

major pharmaceutical companies and medical personnel. Demand for Alberta cost data continues to increase.

## ***Alberta's Costing Partnership***

Leadership of the Alberta Costing Partnership resides within the Ministry of Health and Wellness. The health funding and costing branch is responsible for carrying on the health costing mandate. Health costing was done in conjunction with six regional health authorities (RHAs) that utilized a common costing framework to generate patient-specific case costs. The six regions in existence during the 2002/2003 costing year<sup>1</sup>:

- ◆ Chinook Regional Health Authority,
- ◆ Calgary Health Region,
- ◆ David Thompson Regional Health Authority,
- ◆ Crossroads Regional Health Authority,
- ◆ Capital Health Authority, and
- ◆ Mistahia Regional Health Authority.

In addition to collecting and submitting cost data, each of the costing regions is expected to appoint a regional costing co-ordinator to represent its region on the Costing Function Team. Team members are expected to provide input to any discussions/decisions regarding the costing framework and process.

One of the major responsibilities of the team is to participate in the costing round table review of the provincial cost results. The participants review the statistical analysis. They also compare costs among the contributing regions and from prior years. Issues identified in this process are investigated and resolved by the team prior to publication of this report.

## ***Contributors to 2002/2003 Cost Development***

Although six RHAs participated in the Alberta Costing Partnership, data was not submitted from three regions -- Chinook Regional Health Authority, David Thompson Regional Health Authority, and Mistahia Regional Health Authority.

Cost data collected for 2002/2003 continued to focus on inpatient and ambulatory care services. In total, cost data submitted by the regions for inpatient services totaled over 194,000 patient records and over 1.9 million costed visits for ambulatory care.

---

<sup>1</sup> On April 1, 2003 a significant restructuring of health regions took effect in Alberta. There are currently nine regions, replacing the 17 regions in operation in 2002/2003.

## *Health Costing in Alberta 2004 Annual Report*

### *Comparison of Cost and Activity Data Collected*

	Inpatient			Ambulatory Care		
	Costed Records	Provincial Activity Reported	Costed Records as % of Activity	Costed Records	Provincial Activity Reported	Costed Records as % of Activity
1997/1998	129,000	335,000	39%	458,000	2.7 Million	18%
1998/1999	144,500	346,000	42%	1.1 Million	3.7 Million	30%
1999/2000	104,000	346,500	30%	1.1 Million	4.2 Million	26%
2000/2001	134,000	343,000	39%	1.4 Million	5.5 Million	25%
2001/2002	185,000	337,500	55%	1.5 Million	5.9 Million	25%
2002/2003	194,000	345,000	56%	1.9 Million	6.2 Million	31%

Cost data was provided from 16 different sites. Each site tracks costs on a patient specific basis in one or more functional centres.

The bulk of the costs for inpatient cases flow from inpatient nursing functional centres; therefore, only sites with the ability to track nursing costs on a patient specific basis are included in this report. Since inpatients routinely receive services in other functional centres such as emergency, diagnostic imaging and laboratory services, regions have developed the capability to track costs in these centres on a patient specific basis. Where this capability does not exist, regions use allocation models to ensure that appropriate costs are properly distributed to inpatient cases.

The costs for ambulatory care cases are not reported where there are no systems to track costs on a patient specific basis in the functional centres directly providing ambulatory care. The following table outlines the facility and availability of patient specific cost information submitted in the 2002/2003 fiscal year.

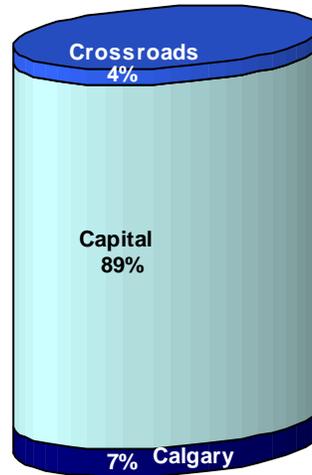

## Health Costing in Alberta 2004 Annual Report

### 2002/2003 Cost Data by Region/Facility

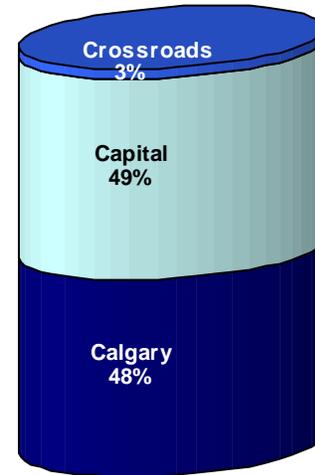

Regional Health Authority	Site	Inpatient	E.R.	Day Procedures	Clinics	DI	Rehab
<i>Chinook</i>	No cost data supplied for 2002/2003						
<i>Calgary</i>	<i>AB Children's</i>	Yes	Yes	Yes	No	Yes	No
	<i>Foothills</i>	Yes	No	No	No	No	No
	<i>Rockyview</i>	Yes	No	Yes	Yes	Yes	No
	<i>Peter Lougheed</i>	Yes	No	No	No	Yes	No
<i>David Thompson</i>	No cost data supplied for 2002/2003						
<i>Crossroads</i>	<i>Breton</i>	No	No	No	Yes	Yes	Yes
	<i>Drayton Valley</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Wetaskiwin</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Crossroads Non-Hospital</i>	No	No	No	No	No	Yes
<i>Capital</i>	<i>Glenrose</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Misericordia</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Grey Nun's</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Royal Alexandra</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>U of A</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Leduc</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Sturgeon</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Northeast Community Centre</i>	No	Yes	No	Yes	Yes	Yes
<i>Mistahia</i>	No cost data supplied for 2002/2003						

The following charts show the number of costed records received from each region (shown as percentages). The Capital Health Authority currently provides the bulk of the ambulatory care cost data. For the other cost pool, inpatient data, the Calgary Health Region and Capital Health Authority provide similar amounts of data.

## Ambulatory Care Records

## Inpatient Records

### Processes for 2002/2003 Cost Development

The process to develop costs was altered in 2002/2003 to reflect changes in data collection at the health record level. In prior years, two years of cost data was blended to create a stable cost figure. In 2002/2003 this blending was not performed because there was evidence that many cases did not flow into the same groups, as they would have in the previous year. The change from ICD-9-CM to ICD10-CA/CCI impacted significantly on this grouping process. The Canadian Institute of Health Information (CIHI) provided the following comments.<sup>2</sup>

“The new classification systems [ICD-10-CA/CCI] are affecting the ability to conduct trend analysis due to the following reasons:

a. Structural changes to the classification:

**ICD-10-CA**

- greater specificity of ICD-10
- new concepts in ICD-10
- combination codes – where previously two codes were required now one combination code is used
- more explicit capturing of post-procedural conditions

<sup>2</sup> “Coping with the Introduction of ICD-10-CA and CCI: Impact of New Classification Systems on the Assignment of Case Mix Groups/Day Procedure Groups Using Fiscal 2002-2003 Data”, Canadian Institute of Health Information, October 2003, p. 6

### **CCI**

- greater specificity of CCI which has over 17,000 codes, compared to 3,600 codes in ICD-9-CM and 3,500 codes in CCP
  - combination codes – where previously two codes were required now one combination code is used
  - use of attributes (status, location, extent) to capture detail that may have been included in a CCP/9CM code
  - generic nature of CCI – captures the what and how of procedures and interventions but not the why. The why is now captured exclusively through the diagnostic classification (i.e. ICD-10-CA). Formerly CCP/CM captured diagnostic as well procedural/interventional information within some codes.
- b. Code-to-code conversion process – mapping from ICD-10-CA and CCI to ICD-9/CM and ICD-9/CCP was done on a one-to-one basis. The code ultimately chosen was based on the closest/best fit. Code selections were ranked on the basis of:
- good fit (exact match of wording and intent)
  - forced fit (same section but no exact match)
  - no match (code did not exist in earlier versions)
- c. Changes in coding standards. In parallel with the development/implementation of the new classification systems, new coding standards have been developed. For example, the World Health Organization introduced new standards for the coding of angina, COPD and pneumonia, as well as the timeframe on the acute phase of a myocardial infarction from eight weeks or less to four weeks (28 days) or less.”

The data submitted was edited for reasonability. The following list describes the type of edit checks used:

- ◆ ambulatory care
  - exclude any visits with a cost less than \$5.00
  - exclude any visits which did not include allocated overhead costs
- ◆ inpatient
  - exclude any visits with a case cost of less than \$200.00 if the length of stay is not one day or less
  - exclude any cases without nursing costs
  - exclude any visits with a cost per day less than \$100.00
  - exclude any visits which did not include allocated overhead costs
  - exclude any visits beyond the trim point

The rest of the costing process remained constant with prior years' cost development.

Although it is not recommended to compare the results from 2002/2003 to previous years, schedules include prior year figures (Schedule 2 compares

inpatient data and Schedule 5 compares ambulatory care data). The 2001/2002 results are based on blended cost data. While not necessary in computing relative values, in order to combine the data and still arrive at appropriate average case costs, it was necessary to inflate the historical data within that year's calculations. Furthermore, the final 2001/2002 results were inflated. The following table lists the various inflation rates:

Fiscal Year of Cost Data	Inflation Rate Applied
2001/2002	6.2%
2000/2001	7.9%
1999/2000	4.9%
1998/1999	2.7%
1997/1998	3.0%

### **Data Flows**

Cost data collected by the participating RHAs is forwarded to the health funding and costing branch of Alberta Health and Wellness on an annual basis.

Processing of the raw cost data is done at Alberta Health and Wellness with the results reviewed and validated in consultation with the Costing Function Team. The process ultimately results in the development of patient-specific case costs, average costs and relative values. The processed cost records reside in the Alberta Health and Wellness database and are available for extraction for research and management purposes subject to the provisions of the *Health Information Act*.

One of the primary users of the information is the health funding unit at Alberta Health and Wellness. For ambulatory care, the system wide relative values are used in the funding formula. Funding for Province Wide Services uses the average costs from the inpatient data.

CIHI also is a significant user of the costing results. The final set of cost data is sent to CIHI to be combined with cost data from Ontario and British Columbia to develop new Resource Intensity Weights (RIWs) by Case Mix Groups (CMGs). The health funding unit uses these RIWs in the funding formula for inpatient care.

The other major users of data are the regional health authorities. Finalized cost and activity data are provided back to the regions in a summarized format. Regions use cost data for rate setting with third party payers and providers, revenue analysis, financial planning, evaluation, and benchmarking. In summary, various users have used the cost information to improve resource allocation and consumption decisions.

## **Data Collection Processes**

The costing exercise is heavily dependent upon data collection systems. There are two components to the data utilized by Alberta Health and Wellness in developing case costs: activity data and patient-specific cost data.

### **Activity Data**

Patient specific activity data is collected by all regions and represents unique information for each particular service. For example, the ambulatory care activity data includes:

- ◆ patient demographics (birthdate, personal health number, gender, etc.),
- ◆ procedure/diagnosis codes,
- ◆ service date,
- ◆ service location,
- ◆ MIS primary,
- ◆ patient disposition, and
- ◆ provider type (optional).

All health regions send both the ambulatory care and inpatient activity data directly to Alberta Health and Wellness using the Morbidity and Ambulatory Care Abstracting Reporting (MACAR) system. The ambulatory care data is grouped with the Alberta-developed Ambulatory Care Classification System (ACCS) grouper. Modifications are made to some of the inpatient records and then submitted to CIHI (Discharge Abstract Database) to be grouped using the CMG grouper. CIHI then returns a file to Alberta Health and Wellness with the group codes.

### **Cost Data**

The costing regions provide patient-specific cost data for both ambulatory and inpatient services. A concerted attempt has been made to parallel the two processes, in keeping with the overall costing framework. Cost data from the regions is submitted directly to Alberta Health and Wellness.

Although the data is submitted only once a year, the regions may send monthly, quarterly, or annual cost files. These files include, for each case, common information that is used to link the data. In addition, the files contain the following diverse information:

1. Patient specific supply costs
  - ◆ patient specific drug costs
  - ◆ patient specific supply costs

These are supply costs that can be directly assigned to specific patients (e.g. operating room supplies, drugs dispensed on a prescription or unit dose basis).

2. Other patient specific cost data
  - ♦ Functional centre direct costs: include all costs (salaries, drugs, medical, and surgical supplies) and other expenses in the patient care functional centres (called absorbing cost centres) for services provided directly to patients. Also, included in these costs are the direct administrative costs associated with the administration of a patient care area, such as salaries of patient care managers and medical staff administration.
  - ♦ Functional centre indirect costs: include costs associated with the administration and support functional centres (called transient cost centres). These indirect expenditures are allocated to patient care functional centres. Examples of these types of costs are general administration and support services such as finance, material management, facilities management, registration, patient food services, and health records.
  - ♦ Non-specific patient drug allocation: are costs for ward stock and other drugs that could not be directly assigned to specific patients.

The submitted costs do not include expenditures not related to patient care. For instance, amortization of building and leasehold improvements, contributed services, or full cost of ancillary operations are excluded.

### ***Cost Data Processes***

The data from the cost data files is initially summarized into one record that includes the total case cost. The second step in the process is to link these costed cases with the separate activity files to derive group assignments. Once linked, the relative values and average costs by group are calculated.

### ***Trimming Data***

Trimming of cost data is a standard practice in the calculation of average case costs and relative values for each cell or group. The trimming process results in the exclusion of those cases that are atypical from these calculations. In the past, trimming of inpatient cases in Alberta was based on the length of stay of the past three years of Alberta inpatient discharges. Because of the trending analysis issue with the ICD-10-CA/CCI coding system, this year trimming of inpatient cases in Alberta was based only on the length of stay (LOS) from the 2002/2003 Alberta inpatient discharges. A trim point is determined for each group and any case with a length of stay beyond the trim point is considered an outlier or an atypical case with an associated higher cost. The rationale

for trimming is that the retention of outliers in the relative value and average cost calculations would lead to the potential over-valuation of services.

The formula used in calculating the inpatient trim point is applied to data from the Discharge Abstract Database and is outlined below:

$$(\text{LOS of third quartile}) + (2 * (\text{LOS of third quartile} - \text{LOS of first quartile}))$$

An acceptable measure for use in trimming ambulatory care data has not been identified. During the review/validation of 1998/1999 costs, the application of a trim point for each ACCS cell based on plus or minus three standard deviations from the cell mean was considered. Upon reviewing the results of this approach, the Costing Function Team determined that this method of trimming would not be employed, as it appeared to exclude a significant number of valid cases.

### ***Grouping of Data***

Nationally, CIHI sponsors the use of the Case Mix Groups (CMG) grouper for inpatient cases. They have developed Resource Intensity Weights (RIWs) for each CMG. The health funding and costing branch began utilizing these RIWs in the 2001/2002 funding calculations.

For grouping of ambulatory care data, the Alberta-developed Ambulatory Care Classification System (ACCS) is used. CIHI also sponsors a national ambulatory care grouper, Comprehensive Ambulatory Classification System (CACS), which is modeled upon Alberta's ACCS. Discussions regarding the merit of switching from ACCS to CACS are ongoing. Until a final decision is made, the ambulatory care cost results will be produced by ACCS.

### ***CMG Grouper***

The CMG grouper groups patients together who are similar in terms of resources used. The variables required to define the Case Mix Groups are:

- ◆ most responsible diagnosis,
- ◆ weight (for neonates),
- ◆ presence or absence of operating room procedures,
- ◆ surgical hierarchy/medical hierarchy, and
- ◆ diagnosis types 1, 2, W, X, and Y.

The complexity overlay on the CMG codes enhances the prediction of utilization of acute care resources within medical/surgical specialties. A complexity level is not applied to a CMG code unless it improves homogeneity in length of stay (LOS) or total resource use. The variables used in assigning the complexity levels are:

- ♦ major clinical categories/case mix groups,
- ♦ pre-admission comorbidity (type 1 diagnosis),
- ♦ post-admission comorbidity (type 2 diagnosis),
- ♦ service transfer diagnosis (type W, X, or Y diagnosis)
- ♦ comorbidity grades,
- ♦ number of body systems involved, and
- ♦ number of “complex” comorbidities.

The complexity levels are as follows:

- Plx 1 – no complexity,
- Plx 2 – complexity related to chronic conditions,
- Plx 3 – complexity related to serious/important conditions,
- Plx 4 – complexity related to potentially life-threatening conditions, and
- Plx 9 – complexity not applied (for instance, the complexity may already be captured within the CMG assignment methodology).

A Plx group is the combination of CMG code + Plx Level. CIHI also applies an age overlay to each Plx group based on the age of the patient:

- 1 – 0 to 17 years old,
- 2 – 18 to 69 years old, and
- 3 – 70 plus years old.

There are 478 CMG codes and 1588 Plx groups. When the age overlay is applied to these Plx groups, the result is 4762 new codes (commonly referred to as Aplx cells). Unfortunately, there are low volume concerns for the majority of these Aplx cells using the Alberta costing data. Therefore, the cost results by CMG code + Plx level + age group are not published in this report.

The 2002/2003 inpatient data was classified using CMG/Plx 2002.v.3. A relative value was calculated for most CMG groups. After the costing calculations were complete, there were some Plx groups where activity existed in the morbidity file but no relative value was derived. For these Plx groups, system wide relative values were estimated based on related Plx groups.

When the Alberta Costing Partnership began in 1997/1998, the Refined Diagnosis Related Groups (RDRG) grouper was used to group the activity data. Therefore, costing results from 1997/1998 to 1999/2000 are based on these groups, instead of CMGs.

### **ACCS Grouper**

The Ambulatory Care Classification System (ACCS) was developed in Alberta. The project began in 1989 under the direction of Alberta Health and Wellness with the intent to create an ambulatory care grouper tailored to Alberta

specifications. The project began with a review of existing groupers (DPGs, PACs, EDGs) and used these building blocks, in combination with Alberta data, to develop ACCS.

To run the ACCS grouper the required data consists of patient demographics and visit related information such as diagnosis/procedure code, mode of service, date of service, patient disposition, etc. The ACCS grouper used to classify the cost data this year was composed of 423 groups. There were only 15 groups with no cost data reported, leaving a total of 408 groups populated to some degree. Those cells for which activity had been reported, but had zero costed cases represented another challenge. Based on the Costing Function Team recommendation, the overall average cost was considered as a reliable estimate for these remaining cells.

The authors and managers of ACCS have the ability to modify the grouper based on Alberta results, or to meet specific needs within the province. For instance, a review of the resource homogeneity of a number of ACCS grouper cells was undertaken in early 2000. In addition to an examination of the relative resource homogeneity of each of the groups, a review was done of the need for a number of under-populated or similar groups.

### ***Grouping Results***

Each of the schedules includes a list of the ACCS or CMG group numbers along with the descriptive name of each group. For more information on the contents of each group (i.e. ICD-10-CA/CCI codes), it will be necessary for interested parties to go to source documents for the respective groupers. Information on the ACCS grouper can be obtained from the health funding and costing branch of Alberta Health and Wellness (780-427-7040).

Only a small number of ungroupable records were found in both the inpatient and ambulatory care activity and cost submissions.

### ***Data Top Up***

In the past, the availability of five years of consistent cost data resulted in a much more extensive data set upon which to base average costs and also a reduced requirement to rely upon other jurisdictions' data for top-up. Top-up is the generally accepted practice of supplementing any low volume cells with cost data from historical data or another jurisdiction. No attempt is made to top-up any cells for which no cases had been reported within the province.

Determining the top-up threshold is somewhat a subjective decision. In Alberta, the standard has been set at five, meaning that any cell with four or fewer cost records will require topping-up with additional cost data.

Unfortunately, the comparability of years is no longer reliable with the switch from the ICD-9-CM classification system to ICD-10-CA/CCI systems. Consequently, top-up was not used in the 2002/2003 costing process. Please note that in schedules 2 and 5 the comparable 2001/2002 data does include top-up data.

### ***Contribution to National Resource Intensity Weights***

On an annual basis, Canadian Institute for Health Information (CIHI) develops and publishes a schedule of Resource Intensity Weights (RIWs) based on their CMG grouper. RIWs are also published for Day Procedure Groups (DPGs). According to CIHI's Web page<sup>3</sup>

“The Resource Intensity Weights (RIW) system is a relative resource allocation methodology for estimating a hospital's inpatient-specific costs for both acute and day procedure care. RIW is used to standardize the expression of hospital case volumes, recognizing that not all patients require the same health care resources. Volume is then expressed as "weighted cases".

“Uses

- translating case mix data into cost data
- determining unit costs for atypical cases
- identifying priorities by CMG for utilization management
- planning new programs
- evaluating program efficiency”

Alberta Health and Wellness provided CIHI with inpatient and ambulatory care case costs in previous years. It is expected that the final costs from 2002/2003 for inpatient and ambulatory care will also be provided to CIHI, for use in the development of future RIWs.

The national RIW technical working group reviewed the initial data submitted for costing by Alberta Health and Wellness. They assessed it against the following criteria:

- ◆ the methodology for capturing cost data must be documented,
- ◆ sufficient data volume must exist,
- ◆ supply of data should be available on a timely basis, and
- ◆ data must be statistically valid.

---

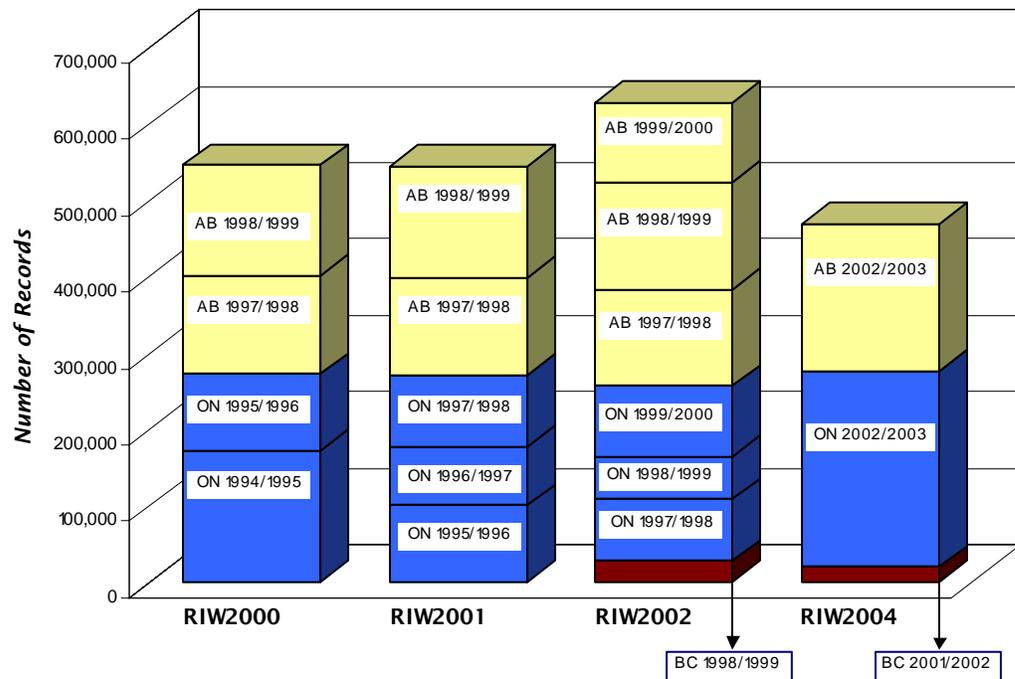

<sup>3</sup> RIW™ and Expected Length of Stay Methodology at [http://secure.cihi.ca/cihiweb/dispPage.jsp?cw\\_page=casemix\\_riw\\_e](http://secure.cihi.ca/cihiweb/dispPage.jsp?cw_page=casemix_riw_e) as at May 15, 2003.

## *Health Costing in Alberta 2004 Annual Report*

The review concluded that the quality as well as comparability with existing Ontario data made Alberta data an excellent contributor to the national RIWs. The all-Canadian RIW information is believed to be more reflective of the non-profit environment in Canada.

Every year the set of data utilized to develop the RIWs changes as both Alberta and Ontario continue to send updated records from more recent years. Also, starting with RIW2002, data from British Columbia was included in the development of RIWs.

**Comparing Data Utilized by CIHI in Developing RIWs**

### **Conclusion**

In its sixth year, the Alberta Costing Partnership has once again produced Alberta costs for both inpatient and ambulatory care. The significance of this achievement can be demonstrated by the widening interest, which continues to be expressed by other health organizations and researchers. In particular, the contribution and acceptance of Alberta cost data in the development of national Resource Intensity Weights through CIHI attests to the quality of the work that has been done in the province. As well, Alberta continues to lead the rest of the country in comprehensively collecting and costing ambulatory care data.

## *Health Costing in Alberta* *2004 Annual Report*

---

The continued success of the Alberta Costing Partnership could not have occurred without the dedication and commitment of RHA and Alberta Health and Wellness staff. The cost results included in this report are the product of many hours of effort, an achievement of which all participants can be proud.

The health funding and costing branch would like to thank all those individuals who have contributed to this work and look forward to continuing the partnership.

## Appendix

### Cost Weight Development

The process used by Alberta Health and Wellness to develop cost weights or relative values for each of the inpatient and ambulatory care groups is based on the hospital specific relative value methodology.

Calculating relative values adjusts for differences in utilization patterns and pricing (costing) between facilities. Because this allows for easy combining of data from different provinces and across years, it produces a set of relative values that do not require complex adjustments to make the data comparable. This method first calculates the hospital specific relative value (HSRV) for each group (ACCS cell, CMG, or Plx group) for each hospital, then derives an initial system wide (including all hospitals) relative value (SWRV), and finally calculates a case mix index (CMI). While the steps below are based on ambulatory care calculations, a similar process is undertaken for the inpatient data.

#### HSRV - Step 1

Raw costing information is received from the costing regions and processed at Alberta Health and Wellness. An average cost per case is calculated for each ACCS cell. These costs are then available as input into the relative value calculation process.

ACCS #	Description	Hospital A		Hospital B		Province-Wide	
		Cases	Average Cost \$	Cases	Average Cost \$	Cases	Average Cost \$ (wtd avg.)
26	Hernia	2	\$300.00	6	\$450.00	8	\$412.50
62	Hemodialysis	5	\$200.00	10	\$300.00	15	\$266.67
1009	Sprains	9	\$100.00	16	\$150.00	25	\$132.00
	Total Hospital	16	\$156.25	32	\$253.13	48	\$220.84

#### HSRV - Step 2

The relative value calculation requires cost data by institution and by group. First, the average cost per case by ACCS code, by facility, is divided by the average cost for all cases in that facility (average institution case cost) to derive the HSRV for each ACCS cell. This allows us to look at the cost of an ACCS code relative to other ACCS codes in that facility rather than at the average cost.

## Health Costing in Alberta 2004 Annual Report

		Hospital A		
ACCS #	Description	Cases	Average Cost \$	Hospital Specific Relative Value (HSRV)
26	Hernia	2	\$300.00	$\$300/\$156.25=1.92$
62	Hemodialysis	5	\$200.00	$\$200/\$156.25=1.28$
1009	Sprains	9	\$100.00	$\$100/\$156.25=0.64$
	Total Hospital	16	\$156.25	N/A

### HSRV - Step 3

The initial SWRVs are calculated for each ACCS code by taking a weighted average of the hospital specific relative values from each facility. For each facility, the number of cases in an ACCS cell is multiplied by the HSRV for that ACCS cell. Then, divide this result by the total number of cases in the system (province) for that particular ACCS code. The sum of the results of this calculation for all facilities is the initial SWRV.

		Hospital A			Province-Wide
ACCS #	Description	Cases	Average Cost \$	Hospital Specific Relative Value (HSRV)	Initial System Wide Relative Value (ISWRV) (wtd.avg. Of HSRVs)
26	Hernia	2	\$300.00	$\$300/\$156.25=1.92$	$(1.92*2/8)+(1.78*6/8)=1.8133$
62	Hemodialysis	5	\$200.00	$\$200/\$156.25=1.28$	$(1.28*5/15)+(1.19*10/15)=1.2168$
1009	Sprains	9	\$100.00	$\$100/\$156.25=0.64$	$(0.64*9/25)+(0.59*16/25)=0.6097$
	Total Hospital	16	\$156.25	N/A	N/A

**Note:** Calculates a system wide relative measure of the value of an ACCS cell compared to other ACCS cells

This calculation filters out the differences in efficiencies between hospitals. This can occur if a hospital is a teaching hospital, and would typically incur higher costs per case, or if a hospital uses different technology in treating patients.

### HSRV - Step 4

The CMI adjusts for differences in the case mix of treatments in a hospital. For example, if a hospital typically treats much more severe patients, the CMI will adjust the relative values to take that into account.

For each facility, the CMI is calculated by multiplying the SWRV for each ACCS cell by the number of cases in each cell for that facility. The resulting

## Health Costing in Alberta 2004 Annual Report

values are then summed. This total is then divided by the number of cases treated in that hospital, which results in the facility's CMI.

**Case Mix Index** = sum of adjusted value of cases (SWRV units)/actual number of cases = 15.1976/16 = **0.9498**

		Hospital A			
ACCS #	Description	Cases	Average Cost \$	Initial System Wide Relative Value units = SWRV x # of cases	Adjusted Hospital Specific Relative Value (AHSRV)
26	Hernia	2	\$300.00	1.8133*2= <b>3.6267</b>	1.92*0.9498= <b>1.8237</b>
62	Hemodialysis	5	\$200.00	1.2168*5= <b>6.0840</b>	1.28*0.9498= <b>1.2158</b>
1009	Sprains	9	\$100.00	0.6097*9= <b>5.4869</b>	0.64*0.9498= <b>0.6079</b>
	Total Hospital	16	\$156.25	Total = <b>15.1976</b>	

**Notes:**

- ♦ Cases in Hosp A adjusted using average system wide relative values.
- ♦ Relative value of ACCS adjusted by case mix index for Hospital A

The HSRVs for each ACCS code by facility are then multiplied by that facility's CMI to give a new set of adjusted hospital specific relative values (AHSRVs). For each ACCS cell, these AHSRVs are then summed from all of the hospitals and divided by the total number of cases in each case group to derive a new set of SWRVs.

**HSRV - Step 5**

Steps 3 and 4 are repeated (weighting HSRVs, averaging HSRVs, and adjusting for case mix) until the difference between successive SWRVs is less than 1 per cent.

The final results of the HSRV process for the 2002/2003 inpatient and ambulatory care cost data are outlined in schedules 3 and 6. In these two schedules the results in the "average cost" columns are based on the same set of data used in the costing process to produce relative values (all exclusions, including trimming, are applied to the data).

## **Definitions**

<b>Activity</b>	Total number of cases in Alberta in 2002/2003 reported by all facilities providing health services (schedules 3 and 6).
<b>Average Cost</b>	Average of the specified cost data.
<b>Average LOS</b>	Average length of stay in days; the day of admission is counted but the day of separation is not counted in this calculation.
<b>Blended</b>	Results based on cost records from two years, as well as all top-up records (except for the average LOS in schedule 2, which does not include top-up records). (See Note).
<b>Coefficient of Variation</b>	Measures the spread of the cost data (based on the set of cost records), as a proportion of the average cost (mean). It is the ratio of the standard deviation divided by the mean.
<b>Cost per Day</b>	Total costs divided by total length of stay.
<b>Costed Cases</b>	Includes the number of cases that have been costed. The total number of cases costed for each Case Mix Group (CMG) may not equal the sum of cases costed for each complexity level due to different trim point calculations for CMGs and Plx groups (CMG code + Plx level).
<b>Direct Cost</b>	Includes all costs directly incurred by the department providing the service to the patient. This typically includes health provider costs, direct supervision, supplies, and equipment costs.
<b>Indirect Cost</b>	Includes costs incurred by departments not providing services to patients. This includes administrative services such as finance, human resources, IT, and support services such as plant, costs, material management, housekeeping, admitting and registration, health records and food services.
<b>Low Volume</b>	Cells that have five or fewer costed cases.
<b>Manual Top-Up</b>	A proxy case used to provide an estimated or derived cost when no cases were costed.
<b>Plx Level</b>	Complexity level (see page 10).
<b>Standard Deviation</b>	Measures the variability or distribution of the cost data (based on the set of cost records). It is calculated from the deviations (differences) between each data value and the mean. The more disperse the data is, the larger the standard deviation.
<b>SWRV</b>	System wide relative value (see Appendix).
<b>Trim Point</b>	The length of stay (LOS) value used to exclude some cost records from the calculations, as they are considered to be atypical.

**Note:** 2001/2002 results are based on the blended cost data, appropriately inflated as indicated on page 7. 2002/2003 results are based only on actual 2002/2003 cost records submitted; see page 5 for explanation of why blending did not occur.

### Schedule 1 -- Inpatient Cost Results

CMG Code	Description	Complexity Level	Average LOS	Average Direct Cost	Average Indirect Cost	Average Cost	Cost per Day	Costed Cases
