### ***Frequently Used Acronyms***

ACCS	Ambulatory Care Classification System
CACS	Comprehensive Ambulatory Classification System
CIHI	Canadian Institute for Health Information
CMG	Case Mix Group
CMI	Case Mix Index
HSRV	Hospital Specific Relative Value
MCC	Major Clinical Category
RIW	Resource Intensity Weight
RDRG	Refined Diagnosis Related Group
RHA	Regional Health Authority
SWRV	System Wide Relative Value

## ***Introduction***

The Alberta Costing Partnership has successfully developed patient specific case costs for both inpatient and ambulatory care, for the seventh consecutive year. The partnership consists of five costing regions along with the department of Alberta Health and Wellness.

The 2005 Annual Report discloses the cost of cases that were handled by the participating health regions between April 1, 2003 and March 31, 2004. Cases are grouped by linking to activity data to provide appropriate summary information.

The cost information contained in this publication does not represent the provincial average cost of hospital-based services across the regional health authorities. Rather it reflects the average cost derived from the data submitted by only two health authorities for 12 different sites. The costs from these sites reflect 55 per cent of the provincial level of hospital-based inpatient activity (separations) and 28 per cent of the ambulatory care activity (visits). Although the data submitted have gone through reasonability validation, the Alberta Costing Partnership provides no external assurance over the appropriateness and completeness of cost allocations done by the health authorities.

As in prior years, schedules have been prepared grouping the inpatient costs by Case Mix Groups (CMGs) and ambulatory care costs by the Ambulatory Care Classification System (ACCS). These comprehensive schedules have been augmented in 2005 by the addition of charts in the Inpatient Information section and the Ambulatory Care Information section. These charts highlight the most significant CMGs and ACCS cells in each Major Clinical Category (MCC) and ambulatory care category respectively. Additional summary information regarding the distribution of activity by region, age, gender, procedure and diagnosis is also included.

The 2005 cost schedules were designed to meet the needs of various users. Direct and indirect cost components are provided in schedules 1 and 4. Schedules 2 and 5 provide information on cost trends and schedules 3 and 6 provide statistical data to assist users in assessing the accuracy and relevance of the cost data. Readers are encouraged to refer to the definitions of column headings on page 69.

The major driver behind health costing in Alberta continues to be its use in the calculation of each health region's funding. However, there is an increasing demand for cost information from users in the department, health authorities, and external users.

Outside Alberta, significant interest has been expressed in the work done by the Alberta Costing Partnership, with numerous inquiries received from national bodies, other provincial health ministries, researchers, universities,

major pharmaceutical companies and medical personnel. Demand for Alberta cost data continues to increase.

## ***Alberta's Costing Partnership***

Leadership of the Alberta Costing Partnership resides within the Ministry of Health and Wellness. The health authority reporting and costing branch is responsible for carrying on the health costing mandate. Health costing was done in conjunction with five regional health authorities (RHAs) that utilized a common costing framework to generate patient specific case costs. The five regions are:

- ◆ Chinook Regional Health Authority,
- ◆ Calgary Health Region,
- ◆ David Thompson Regional Health Authority,
- ◆ Capital Health, and
- ◆ Peace Country Health.

In addition to collecting and submitting cost data, each of the costing regions is expected to appoint a regional costing co-ordinator to represent its region on the Costing Function Team. Team members are expected to provide input to any discussions/decisions regarding the costing framework and process.

One of the major responsibilities of the team is to participate in the costing round table review of the provincial cost results. The participants review the statistical analysis. They also compare costs among the contributing regions and from prior years. Issues identified in this process are investigated and resolved by the team prior to publication of this report.

## ***Contributors to 2003/2004 Costs***

Although five RHAs participated in the Alberta Costing Partnership, data was only submitted from two regions – Calgary Health Region and Capital Health.

Cost data collected for 2003/2004 continued to focus on inpatient and ambulatory care services. In total, cost data submitted by the regions for inpatient services totaled over 194,000 patient records and over 1.9 million costed visits for ambulatory care.

### Comparison of Cost and Activity Data Collected

	Inpatient			Ambulatory Care		
	Costed Records	Provincial Activity Reported	Costed Records as % of Activity	Costed Records	Provincial Activity Reported	Costed Records as % of Activity
1997/1998	129,000	335,000	39%	458,000	2.7 Million	18%
1998/1999	144,500	346,000	42%	1.1 Million	3.7 Million	30%
1999/2000	104,000	346,500	30%	1.1 Million	4.2 Million	26%
2000/2001	134,000	343,000	39%	1.4 Million	5.5 Million	25%
2001/2002	185,000	337,500	55%	1.5 Million	5.9 Million	25%
2002/2003	194,000	345,000	56%	1.9 Million	6.2 Million	31%
2003/2004	195,000	353,000	55%	1.9 Million	6.8 Million	28%

Cost data was provided from 12 different sites. Each site tracks costs on a patient specific basis in one or more functional centres.

The bulk of the costs for inpatient cases flow from inpatient nursing functional centres; therefore, only sites with the ability to track nursing costs on a patient specific basis are included in this report. Since inpatients routinely receive services in other functional centres such as emergency, diagnostic imaging and laboratory services, regions have developed the capability to track costs in these centres on a patient specific basis. Where this capability does not exist, regions use allocation models to ensure that appropriate costs are properly distributed to inpatient cases.

The costs for ambulatory care cases are not reported where there are no systems to track costs on a patient specific basis in the functional centres directly providing ambulatory care. The following table outlines the facility and availability of patient specific cost information submitted in the 2003/2004 fiscal year.

### 2003/2004 Cost Data by Region/Facility

Regional Health Authority	Site	Inpatient	E.R.	Day Procedures	Clinics	DI	Rehab
<i>Chinook</i>	No cost data supplied for 2003/2004						
<i>Calgary</i>	<i>AB Children's</i>	Yes	Yes	Yes	No	Yes	No
	<i>Foothills</i>	Yes	No	No	No	No	No
	<i>Rockyview</i>	Yes	No	Yes	Yes	Yes	No
	<i>Peter Lougheed</i>	Yes	No	No	No	Yes	No
<i>David Thompson</i>	No cost data supplied for 2003/2004						
<i>Capital</i>	<i>Glenrose</i>	Yes	No	Yes	Yes	Yes	Yes
	<i>Misericordia</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Grey Nun's</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Royal Alexandra</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>U of A</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Leduc</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Sturgeon</i>	Yes	Yes	Yes	Yes	Yes	Yes
	<i>Northeast Community Centre</i>	No	Yes	No	Yes	Yes	Yes
<i>Peace Country</i>	No cost data supplied for 2003/2004						

The following charts show the number of costed records received from each region (shown as percentages). Capital Health currently provides the bulk of the ambulatory care cost data. For the other cost pool, inpatient data, the Calgary Health Region and Capital Health provide similar amounts of data.

## Ambulatory Care Records

## Inpatient Records

### Processes for 2003/2004 Cost Computations

The process to develop costs once again utilized the blending of cost data. For both inpatient and ambulatory care, the 2002/2003 and 2003/2004 cost data were blended together. Blending two years of cost data increased the database size, which reduced the number of low-volume cells, as well as improved the stability of costs.

In the past, low-volume cells were topped up with cost records from the remaining set of cost data (data from 1997/1998 to 2001/2002). However, in April 2002, abstract coding switched from ICD-9-CM to ICD-10-CA/CCI. This switch had a significant impact on the grouping process. When the 2002/2003 data was reviewed, a number of records did not flow into the same groups as they would have in the previous year. Therefore, the cost data from previous years cannot be used for top up.

While not necessary in computing relative values, in order to combine the data and still arrive at appropriate average case costs, it was necessary to inflate the historical data. An inflation rate of 4.6% was applied to the 2002/2003 data.

The data submitted was edited for reasonability. The following list describes the type of edit checks used:

1. Ambulatory care
  - a) exclude any visits which did not include allocated overhead costs
  - b) exclude any visits grouped to ACCS 3 (nerve injections) with a case cost less than \$16.00

- c) exclude any visits grouped to intervention cells (ACCS groups between 1.1 and 99), excluding ACCS 3 (nerve injections), with a case cost less than \$21.00
  - d) exclude any visits grouped to ACCS 1062, 1101, 1111, 1121, 1201, 2021, 2022, 2051, 2063, 2070, 2082, or 2099 with a case cost less than \$5.00
  - e) exclude any visits grouped to clinical cells not specified in 1.d) with a case cost less than \$11.00
2. Inpatient
- a) exclude any visits with a case cost of less than \$200.00 if the length of stay is not one day or less
  - b) exclude any cases without nursing costs
  - c) exclude any visits with a cost per day less than \$100.00
  - d) exclude any visits which did not include allocated overhead costs
  - e) exclude any visits beyond the trim point

The rest of the costing process remained constant with prior years' cost development.

## **Data Flows**

Cost data collected by the participating RHAs is forwarded to the health authority reporting and costing branch of Alberta Health and Wellness on an annual basis.

Processing of the raw cost data is done at Alberta Health and Wellness with the results reviewed and validated in consultation with the Costing Function Team. The process ultimately results in the development of patient specific case costs, average costs and relative values. The processed cost records reside in the Alberta Health and Wellness database and are available for extraction for research and management purposes subject to the provisions of the *Health Information Act*.

One of the primary users of the information is the health funding unit at Alberta Health and Wellness. For ambulatory care, the system wide relative values are used in the funding formula. Funding for Province Wide Services uses the average costs from the inpatient data.

CIHI is also a significant user of the costing results. The final set of cost data is sent to CIHI to be combined with cost data from Ontario and British Columbia to develop national weights. One set of weights produced is the Resource Intensity Weights (RIWs) by Case Mix Groups. The health funding unit uses these RIWs in the funding formula for inpatient care.

The other major users of data are the regional health authorities. Finalized cost and activity data are provided back to the regions in a summarized format. Regions use cost data for rate setting with third party payers and providers, revenue analysis, financial planning, evaluation, and

benchmarking. In summary, various users have used the cost information to improve resource allocation and consumption decisions.

### **Data Collection Processes**

The costing exercise is heavily dependent upon data collection systems. There are two components to the data utilized by Alberta Health and Wellness in developing case costs: activity data and patient specific cost data.

#### **Activity Data**

Patient specific activity data is collected by all regions and represents unique information for each particular service. For example, the activity data includes:

- ◆ patient demographics (birthdate, personal health number, gender, etc.),
- ◆ responsibility for payment,
- ◆ procedure/diagnosis codes,
- ◆ service dates,
- ◆ service location,
- ◆ patient disposition, and
- ◆ provider type.

“...[A]mbulatory care data includes data from traditional hospital-based programs (such as Emergency and Day Surgery), as well as services delivered in community based settings (such as outpatient clinics) [or private clinics], ... primary and secondary prevention as well as diagnosis, patient education, treatment, and rehabilitative services.”<sup>1</sup>

Inpatient data include hospital discharge data from acute, chronic and rehabilitative facilities (which includes psychiatric institutions and cancer facilities). As the facilities are reporting the activities in a fiscal year, the activity records include visits from Alberta residents, as well as residents from other provinces or from other countries.

All health regions send both the ambulatory care and inpatient activity data directly to Alberta Health and Wellness using the Morbidity and Ambulatory Care Abstracting Reporting (MACAR) system. The ambulatory care data is grouped with the Alberta-developed Ambulatory Care Classification System (ACCS) grouper. Inpatient activity data is collected and submitted to CIHI, where it is incorporated into the Discharge Abstract Database (DAD). CIHI groups this data using a CMG grouper. A file containing the group codes is returned to Alberta Health and Wellness. After the fiscal year has closed,

---

<sup>1</sup> *Ambulatory Care in Alberta Using Ambulatory Care Classification System Data*, Alberta Health and Wellness, August 2004, p. 1.

modifications are made to some of the inpatient records and then the file is regrouped internally using a desktop version of the CMG grouper.

## Cost Data

The costing regions provide patient specific cost data for both ambulatory and inpatient services. A concerted attempt has been made to parallel the two processes, in keeping with the overall costing framework. Cost data from the regions is submitted directly to Alberta Health and Wellness. This cost data does not include payments made to Alberta physicians or allied practitioners. For information on these payments, please refer to the *Alberta Health Care Insurance Plan Statistical Supplement*. The 2003/2004 version is available on the Alberta Health and Wellness website in the News/Media/Resources/Annual Reports section.

Although the data is submitted only once a year, the regions may send monthly, quarterly, or annual cost files. These files include, for each case, common information that is used to link the data. In addition, the files contain the following diverse information:

1. Patient specific supply costs
  - ◆ patient specific drug costs
  - ◆ patient specific supply costs

These are supply costs that can be directly assigned to specific patients (e.g. operating room supplies, drugs dispensed on a prescription or unit dose basis).
2. Other patient specific cost data
  - ◆ Functional centre direct costs: include all costs (salaries, drugs, medical, and surgical supplies) and other expenses in the patient care functional centres (called absorbing cost centres) for services provided directly to patients. Also, included in these costs are the direct administrative costs associated with the administration of a patient care area, such as salaries of patient care managers and medical staff administration.
  - ◆ Functional centre indirect costs: include costs associated with the administration and support functional centres (called transient cost centres). These indirect expenditures are allocated to patient care functional centres. Examples of these types of costs are general administration and support services such as finance, material management, facilities management, registration, patient food services, and health records.
  - ◆ Non-specific patient drug allocation: are costs for ward stock and other drugs that could not be directly assigned to specific patients.

The submitted costs do not include expenditures not related to patient care. For instance, amortization of building and leasehold improvements, contributed services, or full cost of ancillary operations is excluded.

### ***Cost Data Processes***

The data from the cost data files is initially summarized into one record that includes the total case cost. The second step in the process is to link these costed cases with the separate activity files to derive group assignments. Once linked, the relative values and average costs by group are calculated.

### ***Trimming Data***

Trimming of cost data is a standard practice in the calculation of average case costs and relative values for each cell or group. The trimming process results in the exclusion of those cases that are atypical from these calculations. Because of the trending analysis issue with the ICD-10-CA/CCI coding system, this year trimming of inpatient cases in Alberta was based only on the length of stay (LOS) from the past two years of Alberta inpatient discharges. A trim point is determined for each group. Any case with a length of stay beyond the trim point is considered an outlier or an atypical case with an associated higher cost. The rationale for trimming is that the retention of outliers in the relative value and average cost calculations would lead to the potential over-valuation of services.

The formula used in calculating the inpatient trim point is applied to data from the Discharge Abstract Database and is outlined below:

$$(\text{LOS of third quartile}) + (2 * (\text{LOS of third quartile} - \text{LOS of first quartile}))$$

An acceptable measure for use in trimming ambulatory care data has not been identified. During the review/validation of 1998/1999 costs, the application of a trim point for each ACCS cell based on plus or minus three standard deviations from the cell mean was considered. Upon reviewing the results of this approach, the Costing Function Team determined that this method of trimming would not be employed, as it appeared to exclude a significant number of valid cases.

### ***Grouping of Data***

Nationally, CIHI sponsors the use of the Case Mix Groups (CMG) grouper for inpatient cases. They have developed Resource Intensity Weights (RIWs) for each CMG. The health funding and economics branch began utilizing these RIWs in the 2001/2002 funding calculations.

For grouping of ambulatory care data, the Alberta-developed Ambulatory Care Classification System (ACCS) is used. CIHI also sponsors a national ambulatory care grouper, Comprehensive Ambulatory Classification System

(CACS), which is modeled upon Alberta's ACCS. Discussions regarding the merit of switching from ACCS to CACS are ongoing. Until a final decision is made, the ambulatory care cost results will be produced by ACCS.

## **CMG Grouper**

The CMG grouper groups patients together who are similar in terms of resources used. The variables required to define the Case Mix Groups are:

- ◆ most responsible diagnosis,
- ◆ weight (for neonates),
- ◆ presence or absence of operating room procedures,
- ◆ surgical hierarchy/medical hierarchy, and
- ◆ diagnosis types 1, 2, W, X, and Y.<sup>2</sup>

The complexity overlay on the CMG codes enhances the prediction of utilization of acute care resources within medical/surgical specialties. A complexity level is not applied to a CMG code unless it improves homogeneity in length of stay (LOS) or total resource use. The variables used in assigning the complexity levels are:

- ◆ major clinical categories/case mix groups,
- ◆ pre-admission comorbidity (type 1 diagnosis),
- ◆ post-admission comorbidity (type 2 diagnosis),
- ◆ service transfer diagnosis (type W, X, or Y diagnosis)
- ◆ comorbidity grades,
- ◆ number of body systems involved, and
- ◆ number of "complex" comorbidities.<sup>3</sup>

The complexity levels are as follows:

- Plx 1 – no complexity,
- Plx 2 – complexity related to chronic conditions,
- Plx 3 – complexity related to serious/important conditions,
- Plx 4 – complexity related to potentially life-threatening conditions, and
- Plx 9 – complexity not applied (for instance, the complexity may already be captured within the CMG assignment methodology).<sup>4</sup>

A Plx group is the combination of CMG code + Plx Level. CIHI also applies an age overlay to each Plx group based on the age of the patient:

- 1 – 0 to 17 years old,
- 2 – 18 to 69 years old, and
- 3 – 70 plus years old.

---

<sup>2</sup> *Grouping Methodologies: CMG™ and Plx™*, Canadian Institute for Health Information, Revised 2000, p. 9.

<sup>3</sup> *Ibid.*, p. 21.

<sup>4</sup> *Ibid.*, p. 24.

There are 478 CMG codes and 1588 Plx groups. When the age overlay is applied to these Plx groups, the result is 4760 new codes (commonly referred to as Aplx cells). Unfortunately, there are low volume concerns for the majority of these Aplx cells using the Alberta costing data. Therefore, the cost results by CMG code + Plx level + age group are not published in this report.

The final set of 2003/2004 inpatient data was classified using the CMG 2003 Version 2.0 Desktop Grouper. A relative value was calculated for most CMG groups. After the costing calculations were complete, there were four Plx groups where activity existed in the morbidity file but no relative value was derived. For these Plx groups, system wide relative values were estimated based on related Plx groups.

### **ACCS Grouper**

The Ambulatory Care Classification System (ACCS) was developed in Alberta. The project began in 1989 under the direction of Alberta Health and Wellness with the intent to create an ambulatory care grouper tailored to Alberta specifications. The project began with a review of existing groupers (DPGs, PACs, EDGs) and used these building blocks, in combination with Alberta data, to develop ACCS.

To run the ACCS grouper the required data consists of patient demographics and visit related information such as diagnosis/procedure code, mode of service, date of service, patient disposition, etc. The ACCS grouper used to classify the cost data this year was composed of 426 groups.

Originally, average costs were not calculated for 19 ACCS groups, as no cost data was submitted for these groups in the past two years. Of these 19 groups, 11 groups had activity reported in 2003/2004. As mentioned, the costing results are used in regional funding calculations. As part of this calculation, every activity record is assigned a cost value. Consequently, average costs must be estimated for the missing ACCS groups. Based on recommendations from the Costing Function Team, reliable estimates for these cells were based on related ACCS groups or the overall average cost. In total, there were 418 groups populated with an average cost; the remaining eight ACCS groups were not used in the funding formula.

The authors and managers of ACCS have the ability to modify the grouper based on Alberta results, or to meet specific needs within the province. For instance, a review of the resource homogeneity of a number of ACCS grouper cells was undertaken in early 2000. In addition to an examination of the relative resource homogeneity of each of the groups, a review was done of the need for a number of under-populated or similar groups.

### **Grouping Results**

Each of the schedules includes a list of the ACCS or CMG group numbers along with the descriptive name of each group. For more information on the

contents of each group (i.e. ICD-10-CA/CCI codes), it will be necessary for interested parties to go to source documents for the respective groupers. Information on the ACCS grouper can be obtained from the health funding and economics branch of Alberta Health and Wellness (780-427-7040).

Only a small number of ungroupable records were found in both the inpatient and ambulatory care activity and cost submissions.

### ***Data Top Up***

In the past, the availability of five years of consistent cost data resulted in a much more extensive data set upon which to base average costs and also a reduced requirement to rely upon other jurisdictions' data for top-up. Top-up is the generally accepted practice of supplementing any low volume cells with cost data from historical data or another jurisdiction. No attempt is made to top-up any cells for which no cases had been reported within the province.

Determining the top-up threshold is somewhat a subjective decision. In Alberta, the standard has been set at five, meaning that any cell with four or fewer cost records will require topping-up with additional cost data.

Unfortunately, the comparability of years is no longer reliable with the switch from the ICD-9-CM classification system to ICD-10-CA/CCI systems. Consequently, top-up was not used in the 2003/2004 costing process.

### ***Contribution to National Weights***

Alberta Health and Wellness provided CIHI with inpatient and ambulatory care case costs in previous years. It is expected that the final costs from 2003/2004 for inpatient and ambulatory care will also be provided to CIHI, for use in the development of future national weights.

### ***Resource Intensity Weights***

On an annual basis, Canadian Institute for Health Information (CIHI) develops and publishes a schedule of Resource Intensity Weights (RIWs) based on their CMG grouper. RIWs are also published for Day Procedure Groups (DPGs). According to CIHI's Web page<sup>5</sup>

---

<sup>5</sup> Canadian Institute for Health Information. *RIW™ and Expected Length of Stay Methodology* [cited 15 May 2003]. Available from: <[http://secure.cihi.ca/cihiweb/dispPage.jsp?cw\\_page=casemix\\_riw\\_e](http://secure.cihi.ca/cihiweb/dispPage.jsp?cw_page=casemix_riw_e)>.

“The Resource Intensity Weights (RIW) system is a relative resource allocation methodology for estimating a hospital's inpatient specific costs for both acute and day procedure care. RIW is used to standardize the expression of hospital case volumes, recognizing that not all patients require the same health care resources. Volume is then expressed as "weighted cases".

“Uses

- translating case mix data into cost data
- determining unit costs for atypical cases
- identifying priorities by CMG for utilization management
- planning new programs
- evaluating program efficiency”

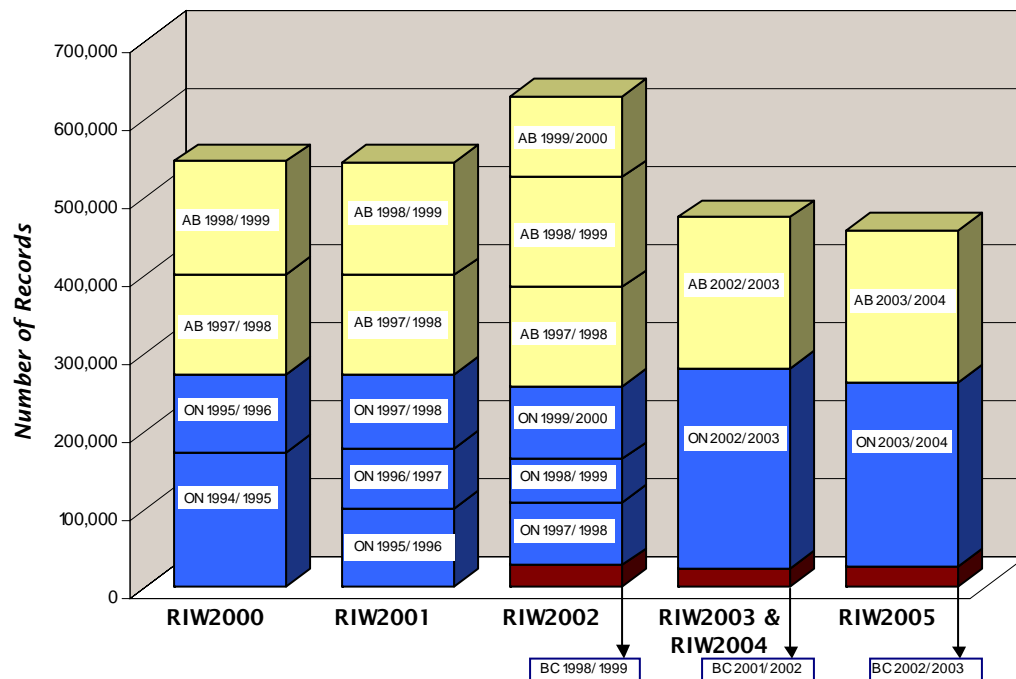

The national RIW technical working group reviewed the initial data submitted for costing by Alberta Health and Wellness. They assessed it against the following criteria:

- ◆ the methodology for capturing cost data must be documented,
- ◆ sufficient data volume must exist,
- ◆ supply of data should be available on a timely basis, and
- ◆ data must be statistically valid.

The review concluded that the quality as well as comparability with existing Ontario data made Alberta data an excellent contributor to the national RIWs. The all-Canadian RIW information is believed to be more reflective of the non-profit environment in Canada (previously RIW included cost data from the United States).

Starting with RIW2002, data from British Columbia was also included in the development of RIWs. The set of data utilized to develop the RIWs changes cyclically as the contributors continue to send updated records from more recent years.

Comparing Data Utilized by CIHI in Developing RIWs

## Ambulatory Cost Weights

CIHI also develops Ambulatory Cost Weights (ACW) for the ambulatory care data grouped by CACS. According to CIHI's web page<sup>6</sup>

“ACW are made to be relative to the average cost of a specific group of patients. This is known as a ‘fixed’ anchor point. The mean cost against which all others are compared is the mean cost for CACS cell 75, “Hemodialysis”. The CACS cell for dialysis is chosen because it represents a very specific patient population and makes up a large proportion of the cost database (>100,000 records). This large sample size ensures a stable estimate of the true cost of performing the service.”

“Uses

- translating CACS data into cost data
- determining costs for atypical cases
- identifying priorities by CACS group for utilization management
- planning new programs & evaluating program efficiency”

<sup>6</sup> Canadian Institute for Health Information. *Ambulatory Cost Weights* [cited 8 July 2005]. Available from: <[http://secure.cihi.ca/cihiweb/dispPage.jsp?cw\\_page=casemix\\_acw\\_e](http://secure.cihi.ca/cihiweb/dispPage.jsp?cw_page=casemix_acw_e)>.

At this point in time, only data from Alberta has been used to develop these weights. It is expected that data from both Alberta and Ontario will be used in the future.

### ***Conclusion***

In its seventh year, the Alberta Costing Partnership has once again produced Alberta costs for both inpatient and ambulatory care. The significance of this achievement can be demonstrated by the widening interest, which continues to be expressed by other health organizations and researchers. In particular, the contribution and acceptance of Alberta cost data in the development of national Resource Intensity Weights through CIHI attests to the quality of the work that has been done in the province. As well, Alberta continues to lead the rest of the country in comprehensively collecting and costing ambulatory care data.

The continued success of the Alberta Costing Partnership could not have occurred without the dedication and commitment of RHA and Alberta Health and Wellness staff. The cost results included in this report are the product of many hours of effort, an achievement of which all participants can be proud.

The health authority reporting and costing branch would like to thank all those individuals who have contributed to this work and look forward to continuing the partnership.

This section contains detailed inpatient information grouped into 25 categories, the Major Clinical Categories (MCC). MCCs are based on body systems or specific types of clinical problems. Each MCC is split into partitions:

- Surgical – a procedure used in CMG assignment was performed during the visit
  - Medical – no procedures used in CMG assignment were performed during the visit
  - Surgical/Medical – corresponding CMG code could be surgical or medical depending on the MCC
- ◆ The table displaying the gender distribution contains the standard male and female codes. There are also two other possible codes:
- – other, for transsexuals or hermaphrodites
  - U – undifferentiated, for stillbirths only
- ◆ The age groups are based on the age categories used by CIHI in CMG assignments. The age calculation is based on the visit date. For reference, the provincial breakdown is as follows:
- |                    |                |       |
|--------------------|----------------|-------|
| 0 to 17 years old  | 773,336        | (24%) |
| 18 to 69 years old | 2,157,681      | (68%) |
| 70 plus years old  | <u>233,735</u> | ( 7%) |
|                    | 3,164,752      |       |
- ◆ Region of residence refers to the regional health authority the recipient resided in at the time of the inpatient or ambulatory care visit. Service provider refers to the regional health authority the hospital is located in. Population by region can be found on the Alberta Health and Wellness website in News/Media/Resources Stats & Facts section.
- ◆ The table displaying the Top Five CMG Groups Based on Activity for Medical Partitions lists some of the common principal diagnosis codes. The principal diagnosis code is<sup>1</sup>:
- “the one diagnosis that describes the most significant condition of a patient that causes his/her stay in hospital’. This may not always be the condition for which the patient is admitted.”
- The diagnosis groupings are based on the first three digits of the principal diagnosis.
  - At least 75 per cent of the records within the CMG will have one of the listed diagnosis codes as the principal diagnosis. The exception would be for CMGs with ++++. For these groups, there are more than five diagnosis codes to represent 75 per cent of the records. Only the first five are listed.
  - The activity and average costs are for the entire CMG; that is, based on all diagnosis codes not just those representing 75 per cent of the records.
  - For CMG 997: Stillbirths, an average cost cannot be calculated, as there are no cost records submitted.
  - Tables containing less than five CMGs include all CMGs belonging to the medical partition in that MCC.

<sup>1</sup> *CMG™/PIX™ Directory 2003 ICD-10-CA/CCI Version (Nov 2003): Introduction -- CMG Methodology Overview*, Canadian Institute for Health Information.

- ◆ The table displaying the Top Five CMG Groups Based on Activity for Surgical Partitions lists some of the most common principal intervention codes (coded as first intervention). The principal intervention code is<sup>2</sup>
  - “the intervention considered to be most significant during the patient’s hospital stay.”
  - The intervention groupings are based on the rubrics, first five digits of the principal intervention.
  - At least 75 per cent of the records within the CMG will have one of the listed rubrics as the principal intervention. The exception would be for CMGs with +++. For these groups, there are more than five intervention codes to represent 75 per cent of the records. Only the first five are listed.
  - The activity and average costs are for the entire CMG; that is, based on all intervention codes not just those representing 75 per cent of the records.
  - Tables containing less than five CMGs include all CMGs belonging to the surgical partition in that MCC.

Due to resource constraints, minor data flaws have not been completely purged from the data. For example, activity data indicate that a few women over 70 years of age received services relating to Pregnancy & Childbirth. Occasionally, fields relating to gender may have been empty.

This section contains detailed ambulatory care information grouped into approximately 25 categories. As MCCs do not exist on the 2003/2004 ambulatory care data, categories were created. These categories are based on the same principle as MCCs, that is, the body system and specific clinical problems. Within each category, the visits are also further separated:

Intervention Related Visits – corresponds to visits belonging to ACCS Groups 1 to 99

Clinical Related Visits – corresponds to visits belonging to ACCS Groups >99

- ◆ The table displaying the gender distribution contains the standard male and female codes. There are also two other possible codes:

O – other, for transsexuals or hermaphrodites

U – undifferentiated, for stillbirths only

- ◆ The age groups are based on the age categories used by CIHI in CMG assignments. The age calculation is based on the visit date. For reference, the provincial breakdown is as follows:

0 to 17 years old	773,336	(24%)
18 to 69 years old	2,157,681	(68%)
70 plus years old	233,735	( 7%)
	3,164,752	

- ◆ Region of residence refers to the regional health authority the recipient resided in at the time of the inpatient or ambulatory care visit. Service provider refers to the regional health authority the hospital is located in. Population by region can be found on the Alberta Health and Wellness website in News/Media/Resources Stats & Facts section.

- ◆ The table displaying the Top Five ACCS Groups Based on Activity for Clinical Related Visits lists some of the main ambulatory care diagnosis codes. The main diagnosis code is<sup>1</sup>

“the diagnosis, condition, problem, or in some cases, the intervention, that is the main reason for the ambulatory care services being provided to the service recipient. . . and is the diagnosis responsible for the greatest use of resources.”

- The diagnosis groupings are based on the first three digits of the principal diagnosis.
- At least 75 per cent of the records within the ACCS group will have one of the listed diagnosis codes as the principal diagnosis. The exception would be for ACCS groups with +++. For these groups, there are more than five diagnosis codes to represent 75 per cent of the records. Only the first five are listed.
- The activity and average costs are for the entire ACCS group; that is, based on all diagnosis codes not just those representing 75 per cent of the records.
- Tables containing less than five ACCS groups include all ACCS groups belonging to the clinical related visits within that category.

- ◆ The table displaying the Top Five ACCS Groups Based on Activity for Intervention Related Visits lists some of the most common main intervention codes (coded as first intervention). The main intervention code is<sup>2</sup>

“the intervention performed and considered by the provider(s) to be the most clinically significant.”

<sup>1</sup> *Alberta Ambulatory Care Reporting Manual Effective April 2003*, Alberta Health and Wellness, p. 59-60.

<sup>2</sup> *Ibid.* p. 59-61.

- The intervention groupings are based on the rubrics, first five digits of the main intervention.
- At least 75 per cent of the records within the ACCS group will have one of the listed rubrics as the main intervention. The exception would be for ACCS groups with +++. For these groups, there are more than five intervention codes to represent 75 per cent of the records. Only the first five are listed.
- The activity and average costs are for the entire ACCS group; that is, based on all intervention codes not just those representing 75 per cent of the records.
- Tables containing less than five ACCS groups include all ACCS groups belonging to the intervention related visits within that category.

Due to resource constraints, minor data flaws have not been completely purged from the data. For example, activity data indicate that a few women over 70 years of age received services relating to Pregnancy & Childbirth. Occasionally, fields relating to gender may have been empty.

**Top Five ACCS Groups Based on Activity for Intervention Related Visits**

### Definitions

- Activity** Total number of cases in Alberta in 2003/2004 reported by all facilities providing health services (schedules 3 and 6). See page 7.
- Average Cost** Average of the specified cost data.
- Average LOS** Average length of stay in days; the day of admission is counted but the day of separation is not counted in this calculation.
- Blended** Results based on cost records from two years, 2002/2003 and 2003/2004 (see Note).
- Coefficient of Variation** Measures the spread of the cost data (based on the set of cost records), as a proportion of the average cost (mean). It is the ratio of the standard deviation divided by the mean.
- Cost per Day** Total costs divided by total length of stay.
- Costed Cases** Includes the number of cases that have been costed. The total number of cases costed for each Case Mix Group (CMG) may not equal the sum of cases costed for each complexity level due to different trim point calculations for CMGs and Plx groups (CMG code + Plx level).
- Direct Cost** Includes all costs directly incurred by the department providing the service to the patient. This typically includes health provider costs, direct supervision, supplies, and equipment costs.
- Indirect Cost** Includes costs incurred by departments not providing services to patients. This includes administrative services such as finance, human resources, IT, and support services such as plant, costs, material management, housekeeping, admitting and registration, health records and food services.
- Low Volume** Cells that have five or fewer costed cases.
- Manual Top-Up** A proxy case used to provide an estimated or derived cost when no cases were costed.
- Plx Level** Complexity level (see page 10).
- Standard Deviation** Measures the variability or distribution of the cost data (based on the set of cost records). It is calculated from the deviations (differences) between each data value and the mean. The more disperse the data is, the larger the standard deviation.
- SWRV** System wide relative value (see Appendix).
- Trim Point** The length of stay (LOS) value used to exclude some cost records from the calculations, as they are considered to be atypical.

**Note:** 2002/2003 results reported on Schedules 2 and 5 are based only on that year's cost data appropriately inflated as indicated on page 5. 2003/2004 results are based on actual 2003/2004 cost records submitted.

## Appendix

### Cost Weight Development

The process used by Alberta Health and Wellness to develop cost weights or relative values for each of the inpatient and ambulatory care groups is based on the hospital specific relative value methodology.

Calculating relative values adjusts for differences in utilization patterns and pricing (costing) between facilities. Because this allows for easy combining of data from different provinces and across years, it produces a set of relative values that do not require complex adjustments to make the data comparable. This method first calculates the hospital specific relative value (HSRV) for each group (ACCS cell, CMG, or Plx group) for each hospital, then derives an initial system wide (including all hospitals) relative value (SWRV), and finally calculates a case mix index (CMI). While the steps below are based on ambulatory care calculations, a similar process is undertaken for the inpatient data.

#### HSRV - Step 1

Raw costing information is received from the costing regions and processed at Alberta Health and Wellness. An average cost per case is calculated for each ACCS cell. These costs are then available as input into the relative value calculation process.

ACCS #	Description	Hospital A		Hospital B		Province-Wide	
		Cases	Average Cost \$	Cases	Average Cost \$	Cases	Average Cost \$ (wtd avg.)
26	Hernia	2	\$300.00	6	\$450.00	8	\$412.50
62	Hemodialysis	5	\$200.00	10	\$300.00	15	\$266.67
1009	Sprains	9	\$100.00	16	\$150.00	25	\$132.00
	Total Hospital	16	\$156.25	32	\$253.13	48	\$220.84

#### HSRV - Step 2

The relative value calculation requires cost data by institution and by group. First, the average cost per case by ACCS code, by facility, is divided by the average cost for all cases in that facility (average institution case cost) to derive the HSRV for each ACCS cell. This allows us to look at the cost of an ACCS code relative to other ACCS codes in that facility rather than at the average cost.

## Health Costing in Alberta 2005 Annual Report

		Hospital A		
ACCS #	Description	Cases	Average Cost \$	Hospital Specific Relative Value (HSRV)
26	Hernia	2	\$300.00	$\$300/\$156.25=1.92$
62	Hemodialysis	5	\$200.00	$\$200/\$156.25=1.28$
1009	Sprains	9	\$100.00	$\$100/\$156.25=0.64$
	Total Hospital	16	\$156.25	N/A

### HSRV - Step 3

The initial SWRVs are calculated for each ACCS code by taking a weighted average of the hospital specific relative values from each facility. For each facility, the number of cases in an ACCS cell is multiplied by the HSRV for that ACCS cell. Then, divide this result by the total number of cases in the system (province) for that particular ACCS code. The sum of the results of this calculation for all facilities is the initial SWRV.

		Hospital A			Province-Wide
ACCS #	Description	Cases	Average Cost \$	Hospital Specific Relative Value (HSRV)	Initial System Wide Relative Value (ISWRV) (wtd.avg. Of HSRVs)
26	Hernia	2	\$300.00	$\$300/\$156.25=1.92$	$(1.92*2/8)+(1.78*6/8)=1.8133$
62	Hemodialysis	5	\$200.00	$\$200/\$156.25=1.28$	$(1.28*5/15)+(1.19*10/15)=1.2168$
1009	Sprains	9	\$100.00	$\$100/\$156.25=0.64$	$(0.64*9/25)+(0.59*16/25)=0.6097$
	Total Hospital	16	\$156.25	N/A	N/A

**Note:** Calculates a system wide relative measure of the value of an ACCS cell compared to other ACCS cells

This calculation filters out the differences in efficiencies between hospitals. This can occur if a hospital is a teaching hospital, and would typically incur higher costs per case, or if a hospital uses different technology in treating patients.

### HSRV - Step 4

The CMI adjusts for differences in the case mix of treatments in a hospital. For example, if a hospital typically treats much more severe patients, the CMI will adjust the relative values to take that into account.

For each facility, the CMI is calculated by multiplying the SWRV for each ACCS cell by the number of cases in each cell for that facility. The resulting values are then summed. This total is then divided by the number of cases treated in that hospital, which results in the facility's CMI.

**Case Mix Index** = sum of adjusted value of cases (SWRV units)/actual number of cases = 15.1976/16 = **0.9498**

		Hospital A			
ACCS #	Description	Cases	Average Cost \$	Initial System Wide Relative Value units = SWRV x # of cases	Adjusted Hospital Specific Relative Value (AHSRV)
26	Hernia	2	\$300.00	1.8133*2= <b>3.6267</b>	1.92*0.9498= <b>1.8237</b>
62	Hemodialysis	5	\$200.00	1.2168*5= <b>6.0840</b>	1.28*0.9498= <b>1.2158</b>
1009	Sprains	9	\$100.00	0.6097*9= <b>5.4869</b>	0.64*0.9498= <b>0.6079</b>
	Total Hospital	16	\$156.25	Total = <b>15.1976</b>	

**Notes:**

- ♦ Cases in Hosp A adjusted using average system wide relative values.
- ♦ Relative value of ACCS adjusted by case mix index for Hospital A

The HSRVs for each ACCS code by facility are then multiplied by that facility's CMI to give a new set of adjusted hospital specific relative values (AHSRVs). For each ACCS cell, these AHSRVs are then summed from all of the hospitals and divided by the total number of cases in each case group to derive a new set of SWRVs.

**HSRV - Step 5**

Steps 3 and 4 are repeated (weighting HSRVs, averaging HSRVs, and adjusting for case mix) until the difference between successive SWRVs is less than 1 per cent.

The final results of the HSRV process for the 2003/2004 inpatient and ambulatory care cost data are outlined in schedules 3 and 6. In these two schedules the results in the “average cost” columns are based on the same set of data used in the costing process to produce relative values (all exclusions, including trimming, are applied to the data).
