16. Abstract

Transport Canada's Transportation Development Centre, the Montreal Port Authority, and prime systems integrator DTI Telecommunications developed a system that integrates automatic equipment identification (AEI) with optical character recognition (OCR) for the automated identification of railcars and containers. In partnership with the Institut national d'optique and the Closed Circuit Television Corporation, DTI completed the integration and carried out improvements to the system's efficiency, accuracy and stability.

This R&D project was undertaken to help the Port of Montreal improve the efficiency and productivity of container movement through the Port. The integration of AEI and OCR technologies into an information technology environment meets the Port community's requirement for timely and accurate information, and provides a basis for improving the level of service to customers.

This report describes the final testing and integration phase associated with the delivery of an AEI/OCR system. A thorough analysis of the AEI/OCR system resulted in hardware and software modification to arrive at the optimal image transfer. The AEI/OCR system prototype achieved an overall performance improvement, with 92 percent ISO container recognition accuracy and the processing and transfer of the results in an electronic data interchange file within 20 minutes.

Benefits from the real-time diffusion of container information include an increase in operation efficiency, reduction of paper records, and advance notice to accelerate the planning and decision-making processes.

16. Résumé

Le Centre de développement des transports de Transports Canada, l'Administration portuaire de Montréal et l'intégrateur principal de systèmes, DTI Télécommunications (DTI), ont mis au point un système intégrant l'identification automatique d'équipement (IAE) et la reconnaissance optique de caractères (ROC), pour l'identification automatique des wagons et des conteneurs. En partenariat avec l'Institut national d'optique (INO) et la firme Closed Circuit Television Corporation (CCTC), DTI a achevé l'intégration des deux technologies et perfectionné l'efficacité, la précision et la stabilité du système ainsi développé.

Ce projet de R&D visait à appuyer l'objectif du Port de Montréal de rendre plus efficaces et plus productifs les mouvements de conteneurs dans le port. L'intégration de l'IAE et de la ROC en une technologie de l'information répond au besoin du Port de Montréal de disposer rapidement d'une information précise, et constitue un premier pas vers une amélioration du niveau de service aux clients.

Le rapport décrit la phase d'intégration ainsi que les essais finaux associés à la réalisation d'un système IAE/ROC. Grâce à une analyse exhaustive du système, les chercheurs ont pu modifier le matériel et le logiciel pour optimiser le transfert d'image. Le prototype IAE/ROC a démontré une amélioration de sa performance globale, soit une précision de 92 p. 100 de la reconnaissance des conteneurs ISO, et le transfert en moins de 20 minutes des informations dans un fichier d'échange de données informatiques (EDI).

La diffusion en temps réel des informations sur les conteneurs présente entre autres des avantages comme l'augmentation de la rentabilité de l'exploitation, la réduction du nombre de documents papier ainsi que la production à l'avance d'informations permettant d'accélérer la planification et la prise de décisions.

ACKNOWLEDGEMENTS

The authors wish to thank Richard Desaulniers of the Port of Montreal; Pierre Pageau, Yves Plasse, Jacques Brunelle and Lorne O'Connor of CCTC; Donald Prevost and Pascal Bourqui of INO; and Ernst Radloff and James Reid of the Transportation Development Centre of Transport Canada for their co-operation throughout this project.

EXECUTIVE SUMMARY

In the intermodal industry there is a growing need for better tracking of containers in transit to improve handling and throughput, increase security, and enable the use of electronic data interchange (EDI). As radio frequency (RF) tags or electronic seals (e-seals) are not in general use in the container shipping industry, automation of the container recognition process must be achieved through the identification numbers printed on the containers. The Port of Montreal (POM) is constantly in search of ways to make the Port system more competitive and productive.

This R&D project was undertaken by Transport Canada's Transportation Development Centre (TDC) to help POM improve the efficiency and productivity of container movement through the Port. The system developed integrates automatic equipment identification (AEI) with optical character recognition (OCR) for the automated identification of railcars and containers. The integration of these two technologies into an information technology environment meets POM's requirement for timely and accurate information, and provides a basis for improving the level of service to customers. It also complements a larger program seeking to achieve fully integrated electronic date interchange (EDI) between Port stakeholders.

The performance of the AEI/OCR system was specified in terms of accuracy and processing time criteria. The minimum required accuracy was established at 80 percent. The time to process the results, including the generation of an EDI file, was to be within 20 minutes of the passage of a "reference train", which was defined as a fully loaded, double-stacked 6000 ft. train equivalent to 120 platforms, each bearing a maximum of three containers. The system was designed to ensure proper operation for train speeds varying between 10 and 20 mph.

The AEI/OCR system installed at POM was initially designed and developed by the Institut national d'optique (INO) under contract to TDC. INO first tested the prototype of the AEI/OCR system in November 2000. In August 2001 DTI was contracted to conduct a second round of tests. Following these tests, problems related to the integration of certain components within the AEI and OCR modules were identified. DTI was then selected to manage work associated with the delivery of an operational prototype, including coordination, supervision and implementation of corrective measures.

DTI was contracted by TDC to carry out the following tasks:

- Consolidate and test the equipment.
- Replace the target lights connected to the OCR software with light beams.
- Make the applications more stable.
- Obtain a better synchronization of information linked to the AEI portion of the software.
- Improve OCR software accuracy.
- Assume the role of systems integrator during this period and coordinate all activities leading to the acceptance of the system.
- Supervise coordinate, verify and obtain approval of the test plans, procedures and results analyses, and implement solutions to ensure the project's success.

DTI, with help from the Closed Circuit Television Corporation (CCTC), verified, corrected and consolidated all of the equipment to make the system fully operational. DTI analysed computer equipment with a series of tests to select the hardware and software configurations for optimal image transfer. The light beams were successfully installed to fix the target light-related

problems. INO and CCTC also improved the software to enhance its efficiency, accuracy and stability.

The results of a first set of tests in November 2002 were very promising: the container code recognition accuracy for 11 trains moves reached 89.9 percent for valid containers. Some problems with the existing image acquisition cardwere encountered, however, as well as frequent stops and a downward shift of certain pixel lines. With TDC's approval, DTI and its partners implemented changes to the image acquisition system to use the Matrox Genesis-LC 3000 acquisition card.

Preliminary tests recommenced for three weeks in February 2003, during which the new acquisition card had to be tested and integrated with the AEI and OCR sub-systems. During this period INO and CCTC made additional software and hardware modifications that yielded results similar or higher to those of the previous tests. In the light of the positive results, DTI decided to begin the acceptance tests phase on 16 March 2003, for a period of two consecutive weeks.

The acceptance tests were successful and yielded a container code recognition accuracy of 91.76 percent for 12 train moves the first week and 90.8 percent for 14 train moves the second week. The overall result for the period was 91.31 percent accuracy for 3,359 valid containers and 87 percent overall accuracy for all 3,494 containers.

The changes made to the computer environment and configuration also resulted in a substantial decrease in data time transfer between the computers and a reduction of processing time. Train moves from 1,309 to 9,821 ft. were observed during the acceptance test period. The processing of the EDI file occurred in less than three minutes after the passage of the train, well under the original 20-minute limit.

All POM requirements were met as a result of the hardware and software improvements made during the project. The acceptance tests demonstrated the undeniable potential of the AEI/OCR prototype to be implemented as an operational system. DTI recommended some modifications to correct certain minor problems, and indicated where the prototype could still be improved and later transformed into a fully operational system that could be used on any site similar to the POM.

SOMMAIRE

L'industrie du transport intermodal a un besoin grandissant de moyens qui lui permettront de mieux suivre les conteneurs en transit et d'améliorer ainsi la manutention et la capacité de traitement des marchandises, de relever la sécurité des contenus et d'utiliser les technologies de l'échange de données informatisées (EDI). Comme l'utilisation d'étiquettes radiofréquences (RFID, pour *radio-frequency identification*) ou de sceaux électroniques n'est pas généralisée dans l'industrie du transport par conteneurs, l'automatisation de la reconnaissance des conteneurs doit encore passer par l'identification de numéros marqués sur le conteneur même. Le Port de Montréal est constamment à la recherche de moyens qui lui permettront de rehausser la compétitivité et la productivité de ses installations.

Ce projet de R&D a été entrepris par le Centre de développement des transports (CDT) de Transports Canada pour appuyer l'objectif du Port de Montréal de rendre plus efficaces et plus rentables les mouvements de conteneurs dans le port. Ce système intègre l'identification automatique d'équipement (IAE) à un moteur de reconnaissance optique des caractères (ROC) pour l'identification automatique des wagons et des conteneurs. L'intégration de ces deux technologies à un environnement de technologie de l'information répond au besoin du Port de Montréal de disposer rapidement d'une information précise, et constitue le premier pas vers une amélioration du niveau de service au client. Il s'inscrit également dans le cadre d'un programme de plus grande envergure qui vise l'intégration complète de l'EDI entre les intervenants en liaison avec le Port.

Les critères retenus pour évaluer la performance du système IAE/ROC avaient trait à la précision et au temps de traitement des données. La précision minimale exigée était de 80 p. 100. Pour ce qui est du temps de traitement des données, y compris de production de fichiers EDI, l'objectif visé était de 20 minutes après le passage d'un «train de référence», défini comme un train à deux niveaux de 6 000 pieds chargé à capacité, soit l'équivalent de 120 plates-formes portant chacune un maximum de trois conteneurs. Le système a été conçu pour fonctionner correctement au passage de trains roulant à des vitesses de 10 à 20 mi/h (15 à 30 km/h).

Le système IAE/ROC installé dans le port de Montréal a été conçu et mis au point par l'Institut national d'optique (INO) en sous-traitance avec le CDT. Le prototype du système a été mis à l'essai une première fois en novembre 2000 par l'INO. Plus tard, soit en août 2001, une deuxième série de tests ont été confiés à DTI. Ces essais ont révélé certains problèmes reliés à l'intégration des différents modules. Par la suite, le CDT a retenu DTI pour la gestion des activités associées à la réalisation d'un prototype opérationnel. DTI est également chargée de coordonner les mesures correctives, de les surveiller et de les mettre en œuvre.

Le CDT a alors confié à DTI les tâches suivantes :

- perfectionner et tester le matériel
- remplacer par des faisceaux lumineux le système d'éclairage de la cible relié au logiciel de ROC
- rendre les applications plus stables
- obtenir un meilleur synchronisme des informations reliées à la composante IAE du logiciel
- amener la précision du logiciel ROC à un degré supérieur
- pendant ces travaux, assumer les fonctions d'intégrateur de système et coordonner toutes les activités devant mener à l'acceptation du système

- assurer la supervision, la coordination, la vérification et l'approbation des plans et méthodes d'essai; faire l'analyse des résultats et mettre en œuvre les solutions élaborées pour garantir la réussite du projet.

DTI, avec la collaboration de Closed Circuit Television Corporation (CCTC), a vérifié, corrigé et perfectionné l'ensemble du matériel de manière à réaliser un système entièrement opérationnel. DTI a soumis le matériel informatique à une série de tests dans le but de retenir l'équipement et les configurations de logiciel produisant les qualités optimales de transfert d'images. On a procédé avec succès à l'installation des faisceaux lumineux afin de régler les problèmes associés à l'éclairage de la cible. L'INO et CCTC ont également amélioré le logiciel pour relever son niveau d'efficacité, de précision et de stabilité.

Une première série d'essais menés en novembre 2002 a donné des résultats prometteurs : pour 11 passages de train, la reconnaissance des codes de conteneurs valides a atteint un degré de précision de 89,9 p. 100. Or, des problèmes sont survenus au niveau du processeur d'acquisition d'images existant, en plus d'arrêts fréquents et d'un décalage vers le bas de certaines lignes de pixels. Avec l'approbation du CDT, DTI et ses partenaires ont apporté au système d'acquisition d'images des changements qui lui permettront de fonctionner avec la carte d'acquisition Matrox Genesis-LC 3000.

Les essais préliminaires ont repris pour une période de trois semaines en février 2003; il fallait tester la nouvelle carte puis l'intégrer aux sous-systèmes IAE et ROC. Durant cette période, l'INO et CCTC ont apporté d'autres modifications, qui ont donné des résultats similaires ou supérieurs à ceux obtenus lors des essais précédents. Compte tenu de ces résultats positifs, DTI entreprendra les essais de réception le 16 mars 2003; ceux-ci s'étendront sur deux semaines consécutives.

Les essais de réception ont été couronnés de succès : la reconnaissance des codes des conteneurs a eu un taux de précision de 91,76 p. 100 pour 12 passages de train pendant la première semaine, et de 90,8 p. 100 pour 14 passages durant la deuxième semaine. Pour la période considérée, les essais ont affiché une précision globale 91.31 p. 100 avec 3 359 conteneurs valides, et de 87 p. 100 pour l'ensemble des 3 494 conteneurs.

Les changements apportés à l'environnement informatique et à la configuration du réseau se sont également traduits par une diminution appréciable du temps de transfert de données entre les ordinateurs et par une augmentation de la vitesse de traitement. Des passages de trains sur une distance de 1 309 à 9 821 pieds ont été observés durant les essais de réception. Le délai de traitement du fichier EDI après le passage du train était inférieur à 3 minutes, ce qui est bien en deçà de la limite initiale de 20 minutes.

Les divers perfectionnements apportés par les chercheurs au matériel et au logiciel en cours de projet ont permis de satisfaire à toutes les exigences du Port de Montréal. Les essais de réception ont démontré le potentiel opérationnel indéniable du prototype IAE/ROC. DTI a recommandé des modifications pour corriger certains problèmes mineurs et indiqué les éléments susceptibles d'être améliorés davantage. Enfin, la firme a souligné le potentiel d'application éventuelle du système dans un environnement entièrement opérationnel similaire à celui du Port de Montréal.

1 INTRODUCTION

With the emergence of a global economy, companies are under more pressure than ever to improve efficiency. In the intermodal transport industry, there is a growing need for better tracking of containers in transit to improve handling operations and throughput, increase security and enable the use of electronic data interchange (EDI) and Internet-based technologies.

This R&D project was undertaken by Transport Canada's Transportation Development Centre (TDC) to help the Port of Montreal (POM) improve the efficiency and productivity of container movement through the Port. It complements a larger program seeking to achieve fully integrated EDI between POM stakeholders. The Automated Equipment Identification/Optical Character Recognition (AEI/OCR) system provides an automated train consist list in EDI format compatible with POM's Information Technologies (IT) environment. The objective was to fully automate the process of building a container train consist in an EDI format and to provide information that can integrate it into the IT and POM's community systems. This would provide value-added service and meet the stakeholder requirement for timely and accurate information.

The AEI/OCR system installed at POM was designed and developed jointly by the *Institut national d'optique* (INO) and its sub-contractor CCTC. This system integrates AEI with a state-of-the-art OCR system developed by INO for automatic identification of railcars and containers. Train images are gathered as the train passes through the system and processed by the OCR program to extract the ISO container code. The recognition task is performed by an OCR engine parsing every image of the train to segment and interpret the ISO 6346 codes painted on both sides of the containers.

The prototype AEI/OCR system as delivered by INO was first tested in November 2000. It successfully demonstrated the specified accuracy for container identification during the acceptance tests of the system installed at POM. However, the specified 20-minute processing time was not met. Following this test period, certain problems related to integration of the different network modules were identified. Among them, the nature and performance of the existing network and the diversity of operating systems used by the sub-systems were presented in the INO test report as being major sources of reliability and network performance problems.

In May 2001 TDC engaged the services of DTI Telecom Inc. (DTI) as a system integrator to work with CCTC on site during the installation, set-up, and test activities to achieve a successful resolution of the network transfer problems. DTI, with the collaboration of INO and CCTC, made many system modifications to solve network performance problems. Consequently, the system was able to achieve the data transfer within the 20-minute processing time. However, it was still a problem to obtain a consistently high container ID recognition rate.

In April 2002 TDC engaged the services of DTI as a system integrator to work with CCTC and INO on-site during the installation, set-up, and test activities to achieve successful resolution of the accuracy problems. The work encompassed the resolution of the system problems, the identification of the elements leading to a solution, and the implementation of corrective measures, including setting up the system prior to testing.

2 SYSTEM OVERVIEW

2.1 Functional Requirements

A complete description of the AEI/OCR prototype system can be found in the report TP 13880E *AEI/OCR System Integration*. The functional requirements of the system are primarily dictated by the rail-side system application. In addition, the system is required to generate an electronic train consist for paperless operations of POM stakeholders. A train consist is basically a list of all the container codes with the code of the platform bearing them. The OCRail software plays its role of the image analysis tool retrieving the container codes found in the train consist.

Fundamentally, the AEI/OCR system consists of three independent processing sub-systems (or sections) referred to as the linear camera controllers (LICOs), OCR and AEI. As the architecture is file-oriented, the main data stream between these sections is a high-speed local area network (LAN) controlled by a 100 MBps switch.

2.1.1 LICO Section

The LICO section comprises two computers handling image acquisition and generating image files. Since linear cameras are used, images are formed in line-scan fashion. A two-dimensional reconstruction of the train is thus achieved by juxtaposition of several line frames. Consequently, the whole length of the train can be considered to be a single image, although its physical representation is divided into smaller, more manageable blocks for convenience.

As the container's identification numbers are printed on both sides of the container, one camera is installed on each side of the track to provide information redundancy. Since double-stacked trains are commonplace, the vertical field of view of the cameras covers the whole height of a double-stacked car in order to capture the container IDs on both levels simultaneously.

2.1.2 OCR Section

The OCR section comprises two computers: Corail2 and Corail3. These handle the recognition of the printed IDs using the images provided by the LICOs. This section is responsible for reducing into a single code ID file the information contained in a large set of images. Section 2.2. describes OCR processing in more details.

2.1.3 AEI Section

The AEI section is responsible, among other things, for reading the AEI tags attached to railcars. Once the OCR processing is complete, the AEI section integrates the AEI information with the OCR information. The result of this integration is a custom EDI-based file that is transmitted to POM.

2.1.4 LAN and Data Flow in the System

The AEI/OCR prototype includes a LAN of computers as shown in Figure 1. As previously mentioned, Corail computers (comprising the OCR section) are connected to the LICOs and the AEI by a file exchange scheme. Corail computers receive and interpret image files produced by the LICOs. LICOs and Corail computers work in pairs as depicted in Figure 1. A LICOs writes the image files directly onto the local hard disk drive of its associated Corail computer.

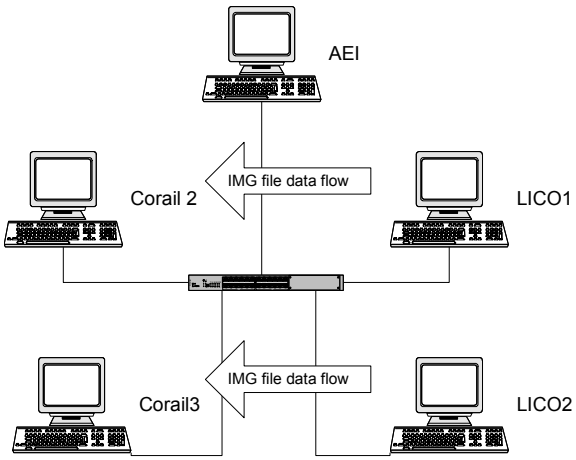

Figure 1 – Schematic of PC LAN topology

2.2 Challenge of OCR Processing

The OCR section handles the recognition of the printed IDs using images provided by the LICOs. The task is divided between two computers, one for each side of the train. Each of the two computers runs a separate instance of the OCRail.exe application. One is configured in primary operation mode, the other in secondary. The only difference between the two is that the primary computer is set to perform the validation phase (i.e., the extra tasks of two-sided analysis and generation of the final result).

In normal operation, processing of the files starts as soon as they appear on the network drive. The OCRail software on each side must process a series of image files that, put together, represent a complete image of the train. The collection of images belonging to a single train is a *move*. Images are generated externally by the LICOs and are directly stored in a custom IMG file format on the Corail computers. Local polling is used to determine whether new files are present. Because the image file generation processes on the LICOs make use of a rigorous naming convention, files are easily related to one side of a specific train and numbered in creation order.

Files are read in succession by each OCRail engine and processed to extract the ISO 6346 code present on the images, if any. At times, an ISO code may end up being distributed over consecutive images. To ensure proper processing in such situations, the files belonging to one camera should be read and processed in their order of creation until the last image of the train is encountered before the images generated by another camera are processed. Image filenames are used to identify their relative creation time. An end-of-train (EoT) flag present in the file structure determines the last image of the train. Thus, for a given move, this flag is set in only one file per camera.

After being read, the image files are filtered to clean up the unimportant information. A candidate region of interest for the location of the code is then searched. When a code is found, processing continues with the determination of the location of the individual characters composing the code. The individual characters are then submitted to an OCR engine for recognition. When this is done, a list of the characters found in the image is assembled. Each computer independently provides OCR information corresponding to the side of the train it is configured to analyse.

When the first recognition phase of processing is completed, a second phase takes place on the primary computer. This is the validation phase, during which the codes belonging to each side are paired as best as possible, and the validity of the ISO code is checked using semantics rules as well as redundancy. Final results are stored into an Intelligent Character Recognition (ICR) file, written back on the AEI computer.

From there on, the AEI-SITE software, in charge of integrating the AEI and OCR data, takes over. Thus container IDs are read from the ICR file and merged with the AEI information to form an EDI file that is sent to POM.

2.3 System Performance

The performance of the AEI/OCR system is a function of both the network data transfer rate and the OCR software program. The software-specific performance figure was assessed by factory testing OCRail 1.1., whereas system-related or network performances was measured as part of the assessment of the global performance of the AEI/OCR prototype.

The network data transfer rate and container identification accuracy specified for the system were conditional on meeting well-defined criteria. The analysis of the test results conforms to specific validity criteria outlined in Table 1.

Table 1 – Transfer rate performance

Objective	Processing time within 20 minutes (from detection of the train to creation of the EDI file containing the data)
Validity criteria	Reference train must pass by the site within 6 minutes 49 seconds at a minimal rated speed of 10 mph Overall processing time must be achieved within 20 minutes Train speed must be between 10 and 20 mph

Table 2 – OCR accuracy performance

Objective	OCR accuracy over 80%
Validity criteria	Container ID code should be compatible with ISO 6346 identification standard Complete ID code must be visible (nothing missing, hidden, erased, or altered) The light beams must be aligned to detect the presence of containers The calibration lights must be functioning for adjustment of camera gain and ambient luminosity; otherwise, over- or underexposure of the images may occur

3 SYSTEM DESCRIPTION

3.1 Overview

The system was developed with several design objectives in mind. It had to have the capacity to extract the ISO 6346-compliant codes present on the containers' walls and assemble them reliably under normal environmental conditions (e.g., dirt, snow, quality of print, effects of ambient light such as shadows, day and night operation, etc.) encountered in the shipping of containers by rail. The system was also required to handle single and double-stacked containers. It had to be able to read the AEI tags of the container-carrying railcars and merge the information from the AEI tags with the containers' ID numbers.

The performance of the AEI/OCR system was specified in terms of accuracy and processing time. The minimum required accuracy was established at 80%. The time to process the results, including the generation of an EDI file, was within 20 minutes of the passage of a fully loaded, double-stacked 6000-ft. train. The system was also designed to ensure proper operation for train speeds varying between 10 and 20 mph (15 to 30 km/h), although the system can also handle slower speeds, train stops, and direction reversals.

The aim of the AEI/OCR system delivered to POM is to perform on-the-fly reading of both the AEI tags present on the railcars and the ID code painted on the containers. The system was designed in 1997-98. Since then, huge technological developments have occurred in the field of imaging sensors and cameras, making it relevant to review the video aspects of the system. The train image acquisition is controlled by dedicated computers and frame grabbers forming part of the LICO sub-system. The images are then sent to the OCR system for processing. A dedicated computer is used to acquire and process the AEI data and merge it with the OCR data. All computers are linked through a high-speed LAN controlled by a 100 MBps switch.

Experience with setting up and operating the prototype also showed that making its main sub-systems less interdependent would lead to simplified calibration and maintenance. This report contains a preliminary discussion for the redesign of the OCR sub-system, including a brief component study.

3.2 Current System Design

3.2.1 Physical Implementation

Figure 2 gives a schematic view of side 1 of the physical layout of the AEI/OCR system. The prototype features a number of sensors distributed, along the trackside. Among them are wheel sensors (axle detectors) to detect the presence of a train and perform speed assessment. The complete system consists of two AEI antennas mounted on each side of the track, three track-mounted railcar wheel sensors, two linear line-scan cameras, a lighting system, and a series of computers and dial-up lines for remote debugging and data transfer. The wheel sensors are used to detect the direction of the train and as a feedback mechanism to control the camera's line rate and maintain a constant pixel aspect ratio.

The post farthest from the track holds the camera and its housing. The line-scan camera has a field of view covering 20 ft., such that a double-stack of containers falls entirely within the vertical field of view.

The post nearest to the track bears a standard AEI antenna (SmartPass) and different types of lighting. The latter includes two main lighting stages (top and bottom), which are responsible for the uniform illumination over the surface of the containers, and a calibration target used to control the gain of the camera. It also includes two light beam sensors whose purpose is to detect container presence on the top or the bottom stack.

The prototype also features a bungalow that shelters the computers and required electronics.

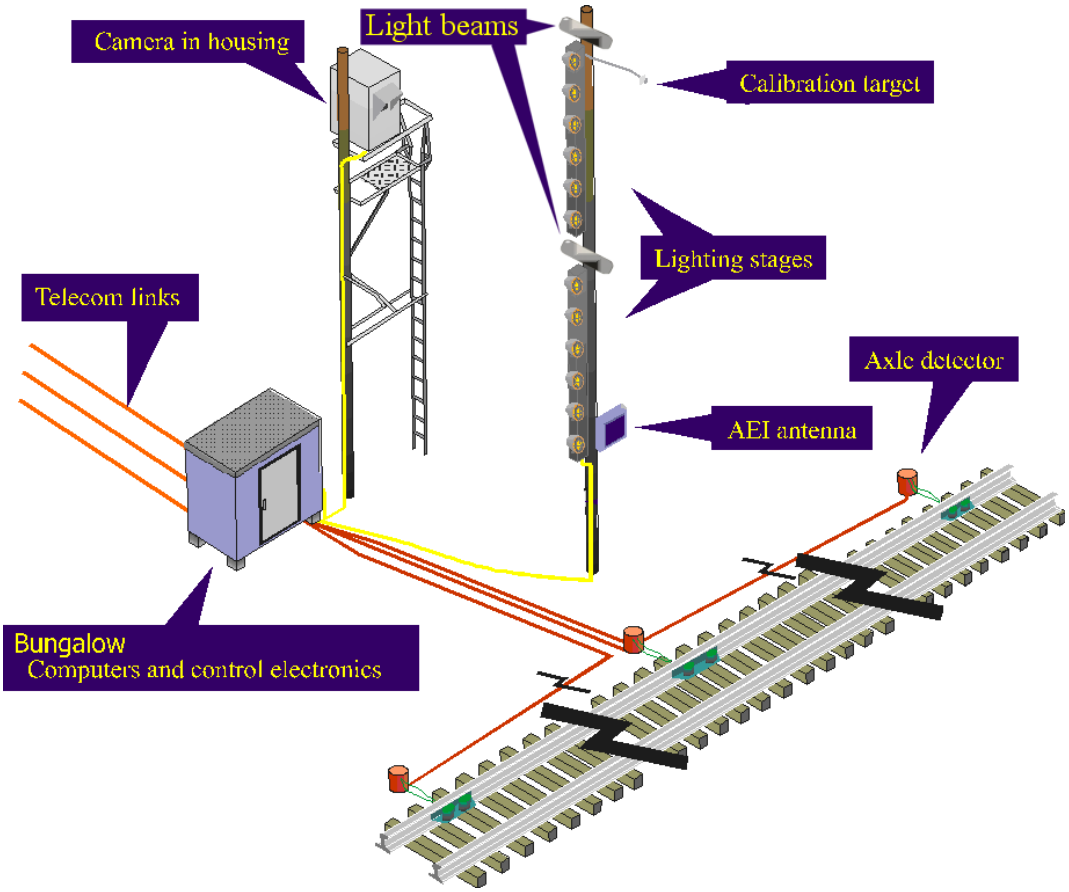

Figure 2 – Site schematics for side 1 of the prototype, and its relation to the track

3.2.2 System Architecture

Fundamentally, the system consists of three independent sub-systems: the LICO, OCR and AEI.

The LICO sub-system handles train detection, image acquisition and file generation (IMG format). Since linear cameras are used, images are formed in line-scan fashion. A two-dimensional reconstruction of the train is thus achieved by juxtaposition of several line frames. Consequently, the whole length of the train can be considered to be a single image, although its physical representation is divided into smaller, more manageable blocks for convenience.

The video module of the LICO sub-system acquires images by sampling the cameras at the maximum rate and sub-sampling the video signal according to the train speed. Speed is obtained from the AEI sub-system. Light beam signals and train-related information is encoded into the image header. The image is written on a designated hard disk drive. The automated gain control strategy is achieved by monitoring the intensity of the target reference light within the images. This intensity is compared to a pre-set reference level to control a motorised iris within the objective of the camera.

The images produced are processed by the OCR sub-systems (one for each camera), which produce a preliminary container code that will be retrieved and merged with the one found on the other side of the container. The resulting code and the relevant train information are then written into a file that will be read by the AEI sub-system.

The AEI sub-system is responsible, among other things , for reading the AEI tags attached to railcars. In addition, it provides timing and speed signals for the linear camera section. Once the OCR processing is complete, the AEI section is also responsible for the integration of the AEI information with the OCR information. The result of this integration is an EDI-based file that is transmitted to POM.

3.3 Design Constraints

This section briefly describes the two main design constraints for the AEI/OCR system.

3.3.1 Train Speed

Train speed is assessed from wheel sensors. The train is going at speeds from 0 to 20 mph.

In order to be versatile, the system should accommodate for train speeds up to 60 mph (100 km/h), assuming that the wheel sensor could reliably measure that speed.

The speed requirement leads to a camera line-scan rate requirement. In fact, the minimum line-scan rate of the camera is the train speed divided by pixel size. The computation was achieved for 1024-, 2048- and 4096-pixel cameras and is shown in Table3.

Table 3 – Required camera line rate as a function of number of pixels

Pixels	Pixel size on container (mm)	Required line rate (kHz)
1024	6	4.6
2048	3	9.2
4096	1.5	18.5

3.3.2 Space Limitation

The footprint of the entire system is of consequence. The actual prototype spans some 20 ft. each side of the track. Reducing the overall space requirement to about 10 ft. each side would potentially lead to a simpler system design, as both illumination and the cameras could be mounted on a single post. The standoff constraint for the camera is thus expressed as any distance up to 20 ft.

4 IMPROVEMENTS TO AEI/OCR SYSTEM PRIOR TO ACCEPTANCE TESTS

4.1 Task 1 – Upgrade Physical Installation and Modify the Electrical Circuit Design

The first task consisted of upgrading or replacing some of the equipment located on site at POM near elevator 5. Equipment such as the camera fixtures, light fixtures, electrical panel, relay box, wheel sensor and computer equipment were modified and/or cleaned to improve the system's operation.

Cleaned: Bungalow and camera fixtures.
Modified: Light fixtures, wheel sensor, electrical panel, relay box.
Modified and cleaned: Computer equipment.

4.1.1 Reinforcement of Side 1

Two torsion bars were supposed to be installed on each camera housing to reduce vibration when trains pass. These two bars were not installed because the results would not have been conclusive enough. Side 1 was reinforced by the installation of three steel cables. The first one runs from the camera post to the metallic structure of the conveyor. The second cable runs from the camera post to the light post of the system on side 1, and the third cable runs from the camera post to the electric sub-station (see Figure 3). The fixtures for the camera housing were reinforced by tightening the screws to their maximum. These modifications were done on August 12th 2002.

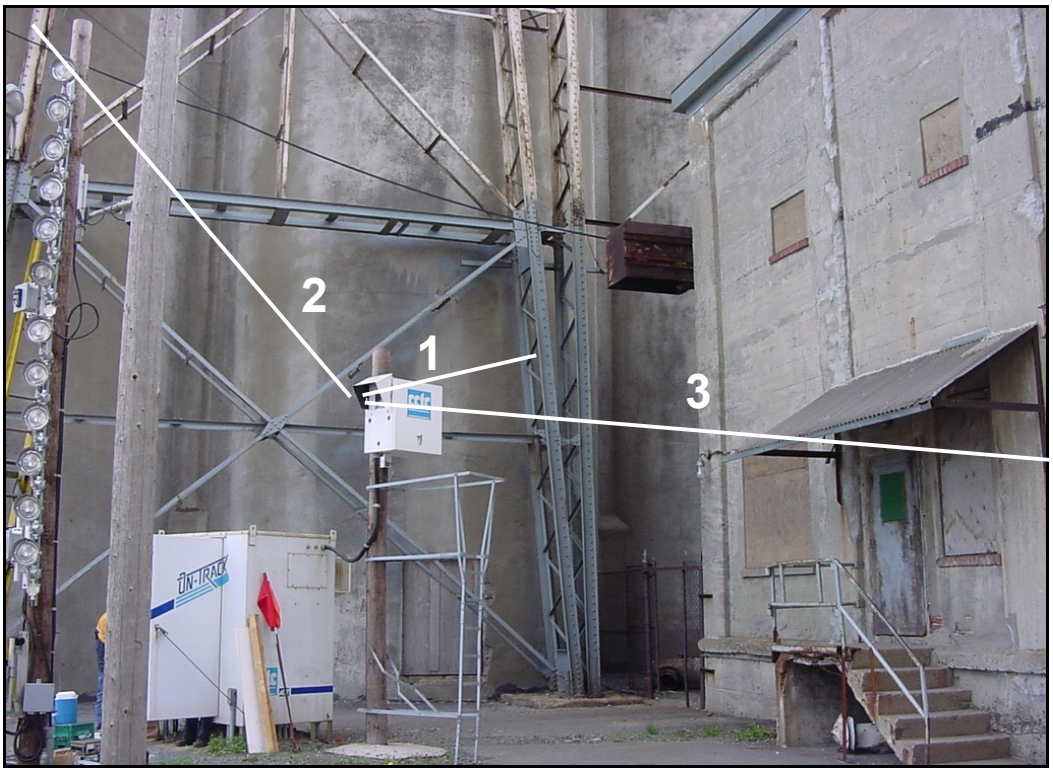

Figure 3 – Diagram of the work done

Figures 4 and 5 present an overview of the cables that were installed to reinforce the post for camera 1.

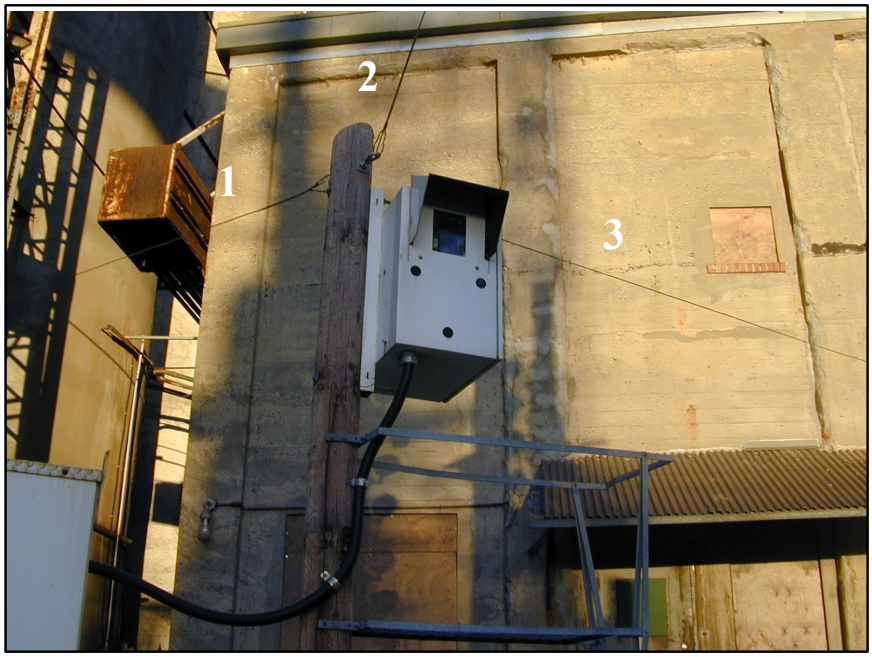

Figure 4 – Overview of cables

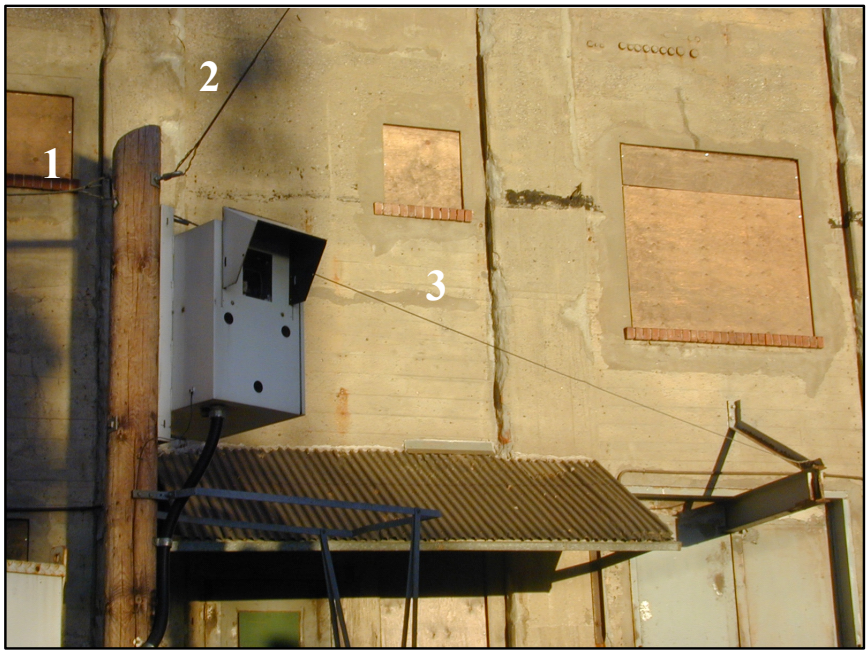

Figure 5 – View of cable 3 to electric sub-station

4.1.2 Reinforcement of Side 2

The fixtures for the camera housing on side 2 were reinforced by tightening the screws to their maximum. The rest of side 2 was not reinforced because there was no structure to which to attach the cables and for safety reasons since there is more vehicle traffic on this side.

4.1.3 Modification of Light Pods

The light fixtures were removed by CCTC on May 13th 2002. The lights were replaced because the parts were corroded. The light pods were redesigned by CCTC. A junction box was installed for each light. The box was attached to the vertical support that was screwed to the post. Using this method combined with the junction boxes made it possible to install a smaller support on the post and reduce sway. The light pods are thus attached more solidly to the post. The fixtures were reinstalled on May 22nd and 23rd 2002 by CCTC.

Figure 6 shows the light fixtures before the modifications and Figure 7 shows the fixtures after the modifications.

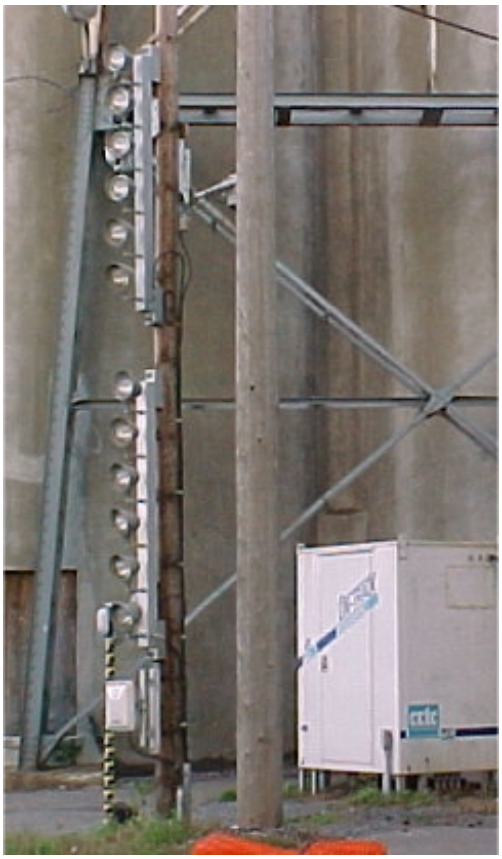

Figure 6 – Light pods before modifications

Figure 7 – Light pods after modifications

Figures 8 and 9 show close-ups of the old and new light fixtures and the part that was replaced because it had corroded.

Figure 8 – Light pods before modifications

Figure 9 – Light pods after modifications

4.1.4 Solid State Relay

The 25A and 45A solid state relays were replaced with 40A relays. They were changed because of the problems encountered with the 25A solid state relays, which were not adequate. The solid state relays on relays 1 to 8 were replaced with 40A relays to standardize the system. The 40As were installed instead of 45As because the 40As were available immediately, whereas there was a delivery period of eight weeks for the 45As. One solid state relay was added to separate the target lights. The work was done on May 28th and 29th 2002 (see Figure 10).

If a relay malfunctions, not all the lights are affected. For example, if relay 1 is not working, only lights 1, 3 and 5 above camera 1 will go out. This configuration makes it possible to maintain a certain amount of lighting above camera 1.

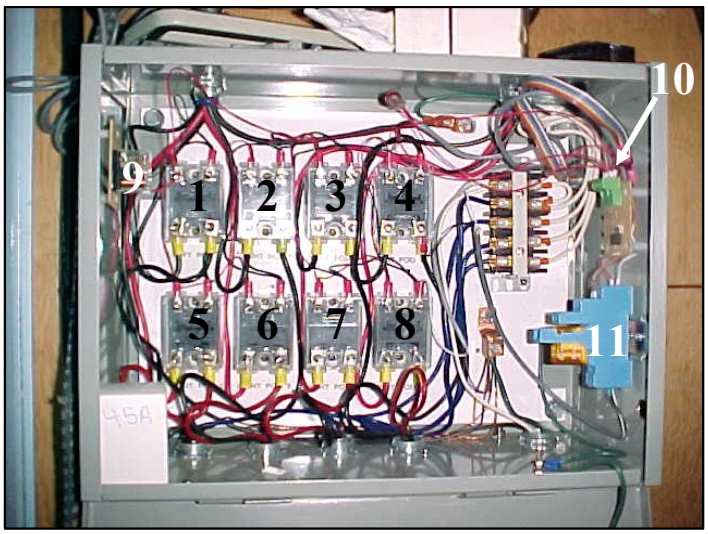

Figure 10 – Relay box

The numbers in Figure 10 match the "diagram #" in Table 4, which gives a description of the relay box with the number of amperes, breakers and lights associated with each item.

Table 4 – Description of relay box

Diagram #	Description	Amps	Breakers	Correspondence with lights
1	Light pod 1	40	Breaker 1	Lights 1-3-5 below camera 1
2	Light pod 2	40	Breaker 5	Lights 7-9-11 above camera 1
3	Light pod 3	40	Breaker 2	Lights 1-3-5 below camera 2
4	Light pod 4	40	Breaker 6	Lights 7-9-11 above camera 2
5	Light pod 1	40	Breaker 3	Lights 2-4-6 below camera 1
6	Light pod 2	40	Breaker 7	Lights 8-10-12 above camera1
7	Light pod 3	40	Breaker 4	Lights 2-4-6 below camera 2
8	Light pod 4	40	Breaker 8	Lights 8-10-12 above camera 2
9	Relay for target lights.	10	Breaker 17	N/A
10	The light pods do not turn on when locomotives pass by. Only the container tags cause the lights to turn on.	N/A	Breakers 1, 3, 5 and 7	N/A
11	Does not trigger detection when locomotives pass by because the light beam signal is only sent once the first tag on a car goes by.	10	Breaker 14	N/A

4.1.5 Breakers

The diagram for the electrical box was redone by DTI, and a CCTC electrician made the changes in the bungalow (see Figure 11). The purpose of the modification was to have a partially functional system, which makes it possible to have results if one of the breakers malfunctions.

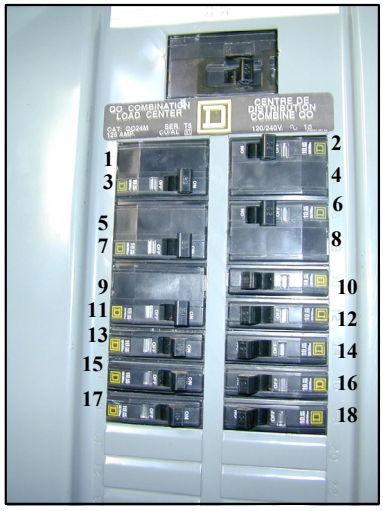

Figure 11 – Electrical box

Table 5 shows the layout and description of the breakers with the old and new configuration.

Table 5 – Layout and description of breakers

Before		After

4.1.6 Wheel Sensor

The A/B wheel sensor was moved to the east to avoid being broken by passing vehicles or machinery. It was installed between the two fences close to the carpet bedding. The protective part was not moved because there was no vehicle traffic between the two fences.

The work consisted of piercing the rail to make two 3/8-in. holes to allow for installation of the sensor. A trench about 12 in. wide was dug about 6 ft. from the track from the current location to the new location. The site was cleared of all asphalt and rock debris. After the work was

completed, the trench was filled with the dirt that had been excavated, and a layer of stone dust was used to finish it off. These modifications were done on August 12th 2002.

Figure 12 shows the area where the trench was dug and the location of the new sensor.

Figure 12 – Area of trench and location of new A/B wheel sensor

Figure 13 shows the old sensor location and the current location, and Figure 14 shows a close-up of the sensor.

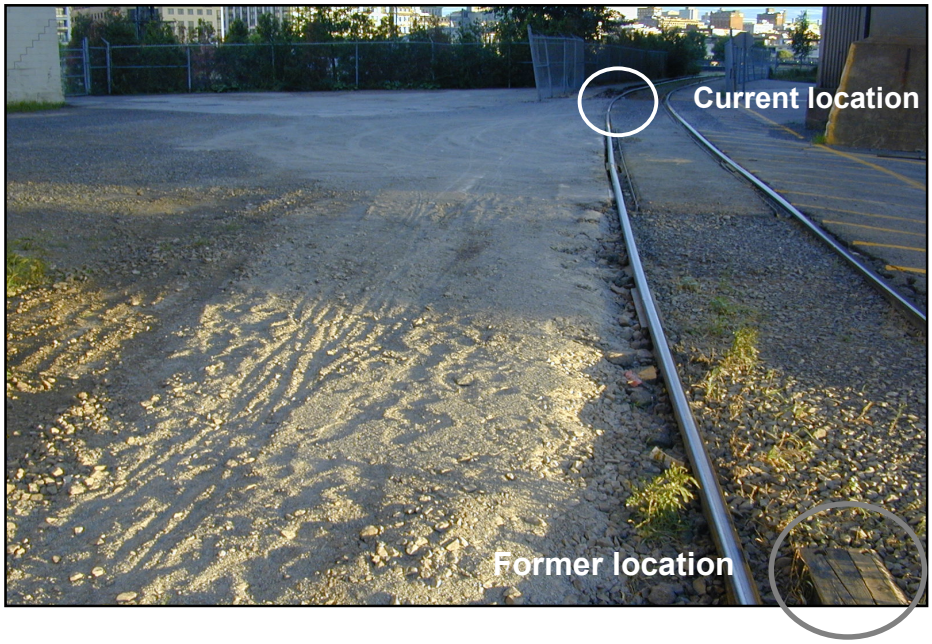

Figure 13 – Old and new location of the A/B wheel sensor

Figure 14 – A/B wheel sensor

4.1.7 Computer Equipment

The computer equipment was removed from the bungalow on March 26th 2002. The equipment was checked and a number of parts not required for the new configurations were returned to POM on May 23rd 2002.

DTI purchased the new equipment listed below to upgrade the system:

- Two Startech SV431D switchboxes
- Two 15 in. Compaq V570 monitors
- Six 6 ft. cables for the SV431D switchboxes
- Two Logitech optical mice
- Two updates of the Diskeeper workstation 7 software
- One hard drive drawer
- One Smart-UPS 1500
- One 40 GB ATA/100 hard drive
- Two 10 ft. CAT5E twisted pair cables

This equipment was tested and installed at POM on June 7th to 10th 2002.

4.1.8 Switches with 6 ft. Cables

Two switches were installed in the bungalow. The first one is located on the left rack and connects the keyboard and mouse for the two Corails, as well as the computer that simulates a server located at POM. The second switch is located on the right rack and connects the keyboard and mouse for the two LICOs and the AEI. When the computers are turned on, they do not need to be selected on the switch for the operating system to detect the presence of a keyboard and mouse.

Figure 15 shows the switch and Figure 16 shows the cables used.

Startech switchbox #SV431D

Front view

Back view

KVM switch cable #SVPS23N1_6

Figure 16 – Cable used for each computer

Figure 15 – Front and back view of switch for monitor

4.1.9 Monitors

The two Compaq V570 monitors (see Figure 17) were successfully tested and installed at POM. The computers are configured for a resolution of 1280 x 1024 pixels. This resolution was chosen because, with a resolution lower than 1024 x 768 pixels, the operating system is not compatible with the switch for the monitors.

Figure 17 – Compaq V570 monitor

4.1.10 Logitech Mouse

Two optical mice were installed for easier use on irregular surfaces (see Figure 18).

Figure 18 – Logitech mouse #930732-040

4.1.11 Diskeeper Software

The Diskeeper software was updated to version 7, which was the most recent one available at the time. It was installed on both Corails.

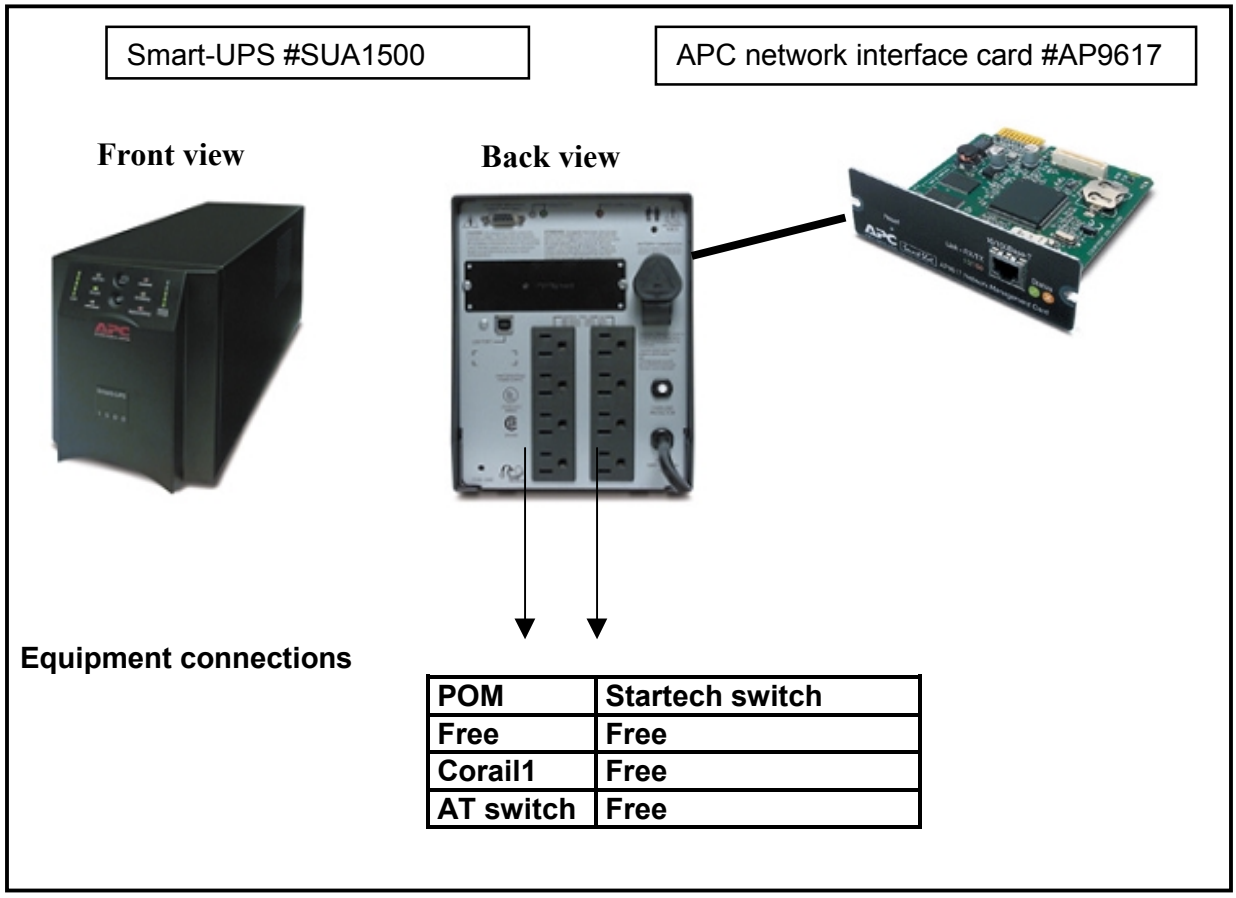
4.1.12 Hard Drive Drawer

One hard drive drawer was installed on the Corail2 to limit access to the disk containing the operating system, thereby speeding up the transfer time (see Figure 19).

Figure 19 – Startech drawer #SNT127A

4.1.13 UPS

The UPS (Uninterruptible Power Supply) is located below the left rack. The Corail1 and POM computers, the switch for the monitor and the AT (Advanced Technology) switch are connected to it (see Figure 20). A second UPS was removed by POM before the reinstallation started. PowerChute software was installed to configure the computer shutdown. A network interface card on the UPS makes it possible to configure the UPS and to add the PowerChute clients.



Equipment connections

POM	Startech switch
Free	Free
Corail1	Free
AT switch	Free

Figure 20 – UPS and equipment connection

Configuration of APC network interface card

The APC network interface card makes it possible to shut down several computers at the same time, using the network in place. It is also used by the computers to communicate with the Smart-UPS for the UPS shutdown configurations (see Table 6).

Table 6 – UPS configuration

Configuration	**Value**
On-Battery shutdown behaviour	Return on line return
Return battery capacity	0%
Low-Battery duration	5 minutes
Shutdown delay	90 seconds
Return delay	180 seconds

On-Battery shutdown behaviour means that the UPS will start operating again when the power is restored.

Return battery capacity defines the minimum capacity required from the battery for the UPS to be able to restart after a shutdown caused by a power failure.

Low-Battery duration defines the time interval that the UPS will continue to run on battery power when the battery is low.

Shutdown delay defines the time interval before the UPS stops operating in response to a shutdown command.

Return delay defines the time interval before the UPS can restart after a shutdown caused by a power failure.

Workstation configuration

The workstations were configured separately according to their task and the UPS's operating time. The first option tells the computer to shut down in the case of a power failure. The second option tells the computer when it must shut down after a power failure. The third option tells the computer whether it is responsible for putting the UPS into Sleeping status. Only one computer is responsible for putting the UPS into Sleeping status when all the other computers are shut down.

Table 7 – Workstation configuration

Corail1 configuration	Value
Yes, I want to shut down the system	Option checked
Shut down the system only when the event lasts this long (seconds)	2700
Turn off the UPS after the shutdown finishes	Option checked

POM configuration	Value
Yes, I want to shut down the system	Option checked
Shut down the system only when the event lasts this long (seconds)	2700

If a power failure lasts more than 45 minutes, POM computer will shut down and the Corail1 computer is in charge of putting the UPS into Sleeping status. When the power is restored, the UPS will start operating to restart the other computers. All the computers will start operating at the same time.

4.1.14 Hard Drive

A 40 GB ATA/100 hard drive was installed in a hard drive drawer to recover the images for analysis. The hard drive is located at the DTI offices.

4.1.15 CAT5E Cable

Two 10 ft. category 5E twisted pair cables were installed in the bungalow. They connect the UPS and the AEI to the AT switch.

4.2 Task 2 – Replace the OCR Target Lights with Light Beams

4.2.1 Light Beams

Photo-electric units were added to detect the beginning and the end of an object. These units contain two pulsed infrared energy beams that operate reliably 99% of the time even in heavy rain, dust storms, fog or snowfall. The frost guard design incorporates special slots in the cover that allow the beams to pass even when the cover is completely frosted over. The design of the OPTEX cover also reduces condensation and evacuates the water that collects, while the sealed optical system provides greater protection against dust and insects. The automatic gain control (AGC) circuit continuously monitors the gradual changes in the strength of the signal caused by the weather conditions and adjusts the triggering level accordingly to maintain the proper sensitivity. The twin beams must both be blocked in order to trigger an alarm. No alarm sounds when a small object blocks only one beam.

The separate signal from each of the two light beams appears as a horizontal strip of 7 pixels at the top of the image in the region where the target light can be seen. These strips carry binary information on the presence or absence of a container group in front of the system. By default there is no signal and what is seen is the target light. Whenever a container cuts the light beam, a dark constant signal appears instead of the target light. The design ensures that a simple threshold will perform as a container detection operator. Note that by construction, there is a spatial shift between the position of the container in the image and the presence signal.

Figures 21 and 22 show a transmitter and a receiver that look identical.

Figure 21 – Transmitter on side 1

Figure 22 – Receiver on side 2

Figures 23 and 24 show the old target lights and the new light beams.

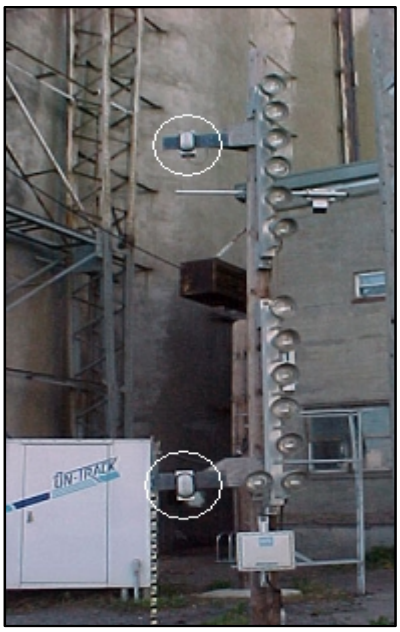


Figure 23 – Before modifications

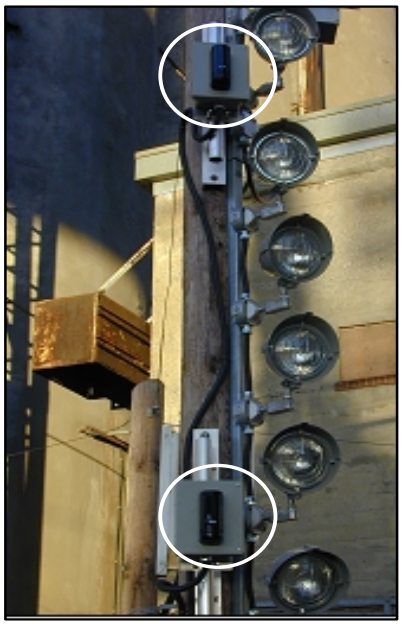

Figure 24 – After modifications

4.2.2 Location

The photo-electric sensors are attached to the light posts on each side of the track. A set consists of one transmitter and one receiver. The transmitters are installed on side 1 and the receivers on side 2 (see Figure 25). The bottom ones are at 9 ft. and the top ones are at 14 ft.

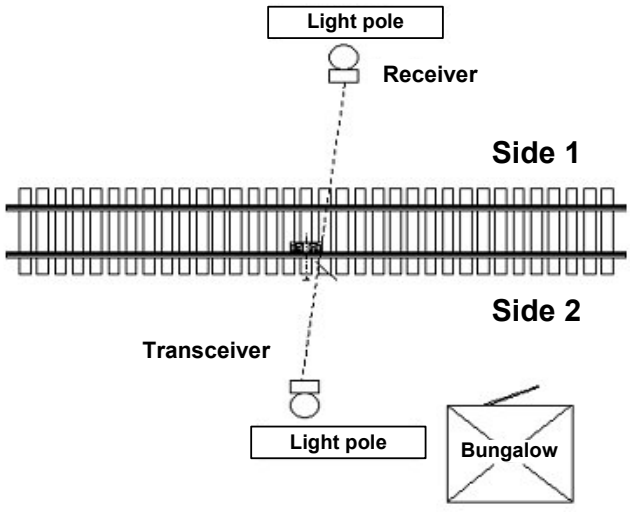

Figure 25 – Location of transmitters/receivers

4.2.3 Cables

The cables used for these modules were pulled through the same conduit as the cables for the AEI antennas. A junction box was installed at the end of the conduit (post side) to provide an output for the wiring for the photo-electric modules. Flexible conduits were installed from each junction box to each photo-electric unit to install the wiring (see Figure 26). The wiring and the flexible conduits make it possible to reposition the transmitter and receiver units up or down by about 2 ft. from the initial position. The +12VDC power for each photo-electric unit was provided by a circuit (see Table 5, breaker 14) separate from the power for the AEI computer and the LICOs so as not to disrupt their operation if a power failure occurs.

The sensing contacts for each set (transmitter and receiver) are connected to the two camera interface boards (LININT), i.e., the master and the slave. This contact generates a change in the first 16 pixels of the image associated with the presence of an object.

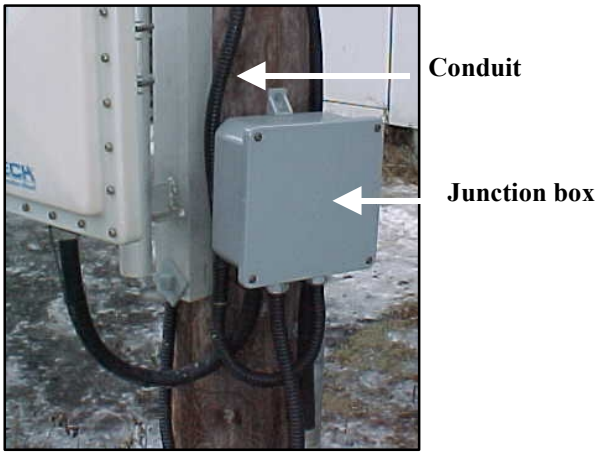

Figure 26 – Junction box and flexible conduit

4.2.4 Operation

When a container passes the transmitters/receivers, the beam is cut, causing a contact to be closed at the alarm output for each photo-electric unit. This detection is sent to the LININT camera input control circuit. The presence of an object produces a black bar at the top of each image. If an object cuts the signal at the second receiver, the black bar appears on the first eight pixels of the line. If the lower photo-electric unit detects an object, the black bar appears on the 8 pixels of the following line. When no object is detected, the video signal is not changed, and a grey area is present on the first 16 pixels of the image.

Figure 27 shows the results of the container detection. The two black bars indicate the presence of a container, and the grey area appears when no container can be seen.

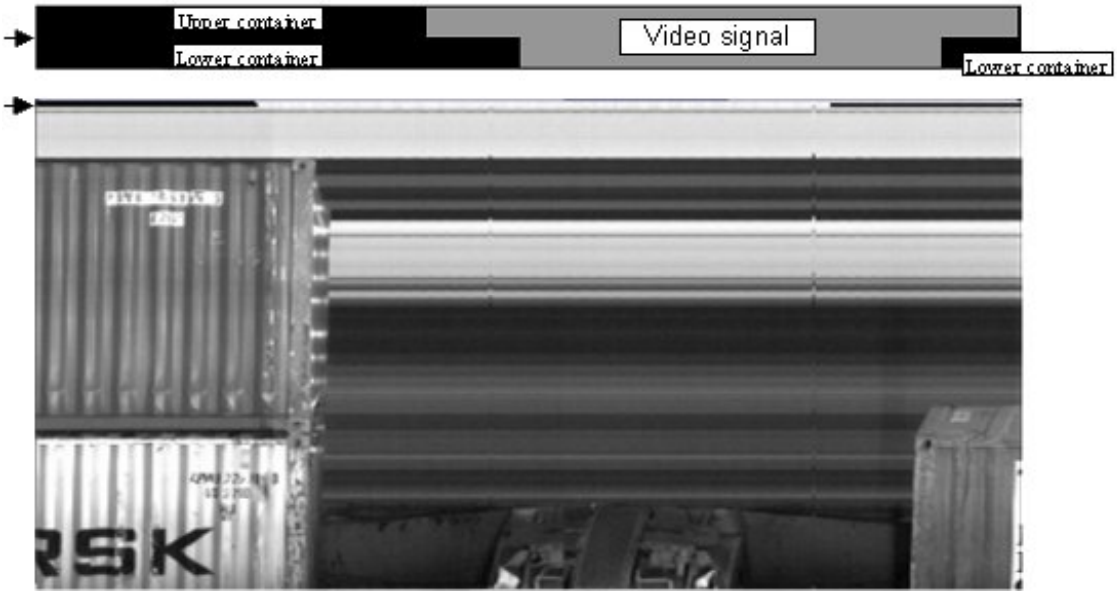

Figure 27 – Container detection

OCRail Software

The OCRail software from INO was modified to take the information in the first 16 pixels of each image into account. In the old version, the software used the signal from the target lights. Now, the light beams are used to detect the containers.

The new segmentation algorithm is applied to determine the placement of the containers in the segment. For example, there may be two 20-ft. containers on the bottom and one 40-ft. container on top (see Figure 28).

Figure 28 – Two 20-ft. containers and one 40-ft. container

In Figure 28, the circled area shows the spot that the segmentation algorithm searches to see whether one or two containers are present. With the signal from the light beams, the algorithm

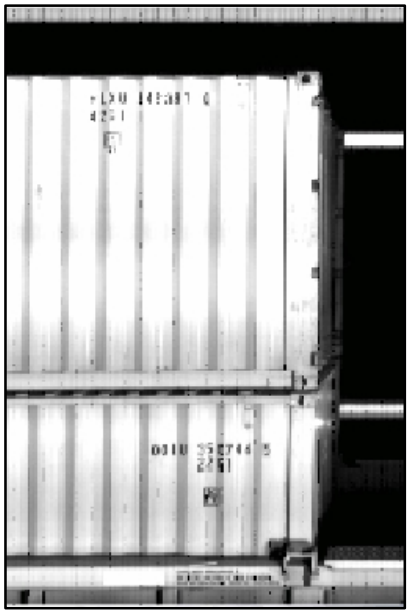
determines the length of the group of containers. The algorithm then searches a specific location to segment the image at the right spot.

The photo-electric sensors were successfully tested at POM by CCTC.

Integration with the rest of the system was also successful. Figure 29 is an image showing that the black bars representing the detection of containers were present at the top of the image.

Figure 29 – Container detection

Figures 30 and 31 show an image of the start of the containers on side 1 before and after the modifications.



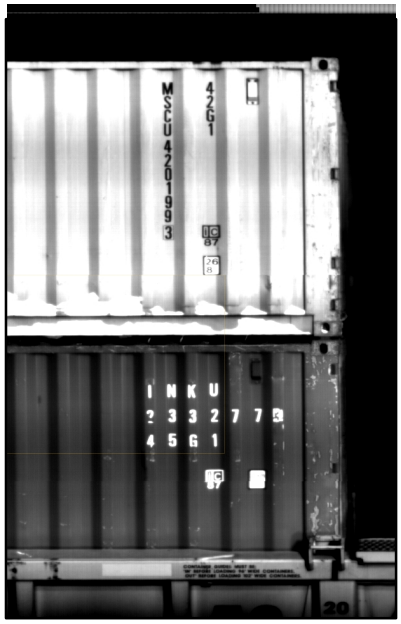


Figure 30 – Start of train before modifications Figure 31 – Start of train after modifications

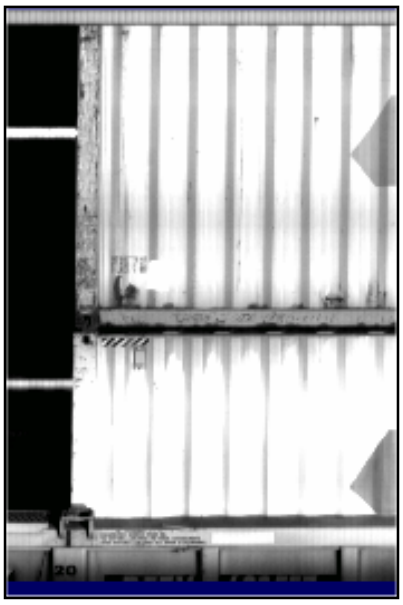
Figures 32 and 33 show an image of the end of the containers on side 1 before and after the modifications.



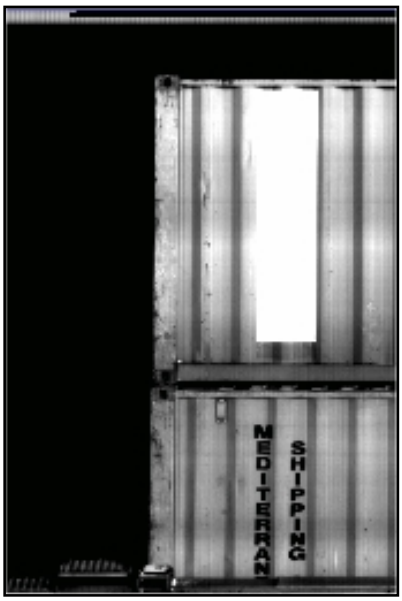


Figure 32 – End of train before modifications Figure 33 – End of train after modifications

4.3 Task 3 – Synzhronize AEI and LICO Programs

The move numbers could become desynchronized between the AEI software and the LICO software. When this happened, the move numbers were different in the resulting files. When a train passed, each LICO program would read its own configuration file to get the next move number. If the LICO files did not have the same move numbers, desynchronization would occur. In addition, the LICO software and the AEI software did not use the same source of information for their next move number. As a result, the LICOs and the AEI were desynchronized.

The desynchronization problem was solved by modifying the AEI and LICO software. A file containing the next move number was added to the AEI. This file is called ‘nextmove.bin’, and is located in the ‘C:\AEI\nextmove\’ directory. When a train passes, the two LICOs read this file on the AEI to get the correct move number. The programs installed on the two LICOs then have the same move number every time a train passes, even if their numbers are not the same before the train goes by. If the ‘nextmove.bin’ file is not available on the AEI, the LICO software will read its own configuration file to get the next move number. This move number is in the ‘lico.ini’ file on each LICO in the 'C:\lico\' directory. The command line that the LICO software reads is ‘last-move-no’. In other words, if the LICO software cannot read the 'nextmove.bin' file on the AEI, it increments its move number by one according to the ‘last_move_no’ line. When it reads the AEI information again, the next move numbers are readjusted according to the ‘nextmove.bin’ file.

Tests were run from 7 to October 11th 2002 to check that this modification worked properly. The tests were successful and the synchronization between the AEI software and the LICO software is excellent. Nevertheless, a correction was made. When LICO1 was stopped, LICO2 did not keep operating to take the images on side 2. When a train tripped the system, the LICO2 software checked whether the clock provided by the LICO1 software was present before proceeding. CCTC made a modification so that LICO2 checks whether the clock provided by the LICO1 software is present. If the LICO2 software has not received a tick from the LICO1 software within 300 milliseconds, it starts the image recording process.

Both LICOs synchronize well with the AEI. However, a problem was noted when the AEI was out of service. The ‘nextmove.bin’ file could not change for each move while the LICO incremented by one each time. When the AEI returned to service, the next move was readjusted according to the ‘nextmove.bin’ file. A duplication of the move numbers then occurred because, while the AEI was stopped, the ‘nextmove.bin’ file was not incremented by one. The AEI is the heart of the system; it must be present to obtain results.

4.4 Task 4 – Upgrade AEI and LICO Platforms to a Windows-based Network

This stage of the project involved upgrading the LICOs and the AEI from the Microsoft Windows 98 operating system to Microsoft Windows 2000 Professional. The computers had to be changed because they were not compatible with Windows 2000. To be compatible, a minimum 133 MHz processor with 64 MB of RAM is recommended. The hard drive must have a minimum of 2 GB of free space to be able to install the operating system. These are the minimum installation requirements, but to have an efficient system, we installed 1 GHz Pentium III processors. Furthermore, a fast system was required in order to complete the image analysis processing within the required timeframe.

4.4.1 LICO and AEI Upgrade

The new parts purchased for the LICO1 and LICO2 machines were the motherboard, processor, RAM and CD-ROM. For the AEI, most of the parts came from the old Corail3. The three computers (LICO1, LICO2 and AEI) were upgraded with the Microsoft Windows 2000 Professional operating system for better stability and performance of the system.

A 3COM network interface card was installed in the AEI on April 23rd 2002 to replace the existing one. This modification was done in order to have the same network interface cards in all the computers. The 3COM cards provide better network performance than the old AT cards used.

Diskeeper Workstation Version 7 software was installed on the LICOs and the AEI to reduce the hard drive fragmentation caused by moving and deleting the images. The computers were tested and the Windows upgrades and various drivers were installed.

4.2.1. Corail Upgrade

Both Corails were upgraded to Pentium 4s and 1.7 GHz processors. For Corail1, only the diskette drive and the network interface card are original parts from Corail3. The other parts were all replaced by new hardware because they were not compatible with the P4 processors. The same is also true for the Corail2, whose only original parts are the diskette drive and the network interface card.

All the hardware was configured and tested at DTI's offices before being installed at POM. It was then tested to ensure that the entire system worked properly in its usual environment.

4.4.2 LICO and AEI Software Modification

CCTC modified the LICO and AEI software programs to ensure that they are compatible with the Microsoft Windows 2000 Professional operating system. The modifications were tested successfully and the LICOs now provide good performance and stability on Windows 2000.

4.4.3 Frame Grabber

The problem with the Data Translation frame grabbers was not solved when the two LICO computers were upgraded to Windows 2000. The issue involved the frequent failure of the two frame grabbers, which caused an image-pairing problem. A new version of the driver was installed on LICO1 on November 18th 2002, but the results were not conclusive. The problems were more frequent after these modifications. There were many glitches and one of the frame grabbers stopped frequently. Furthermore, the timestamps did not have the same value for both sides due to the failure of one of the frame grabbers.

Figure 34 shows a stopped frame grabber.

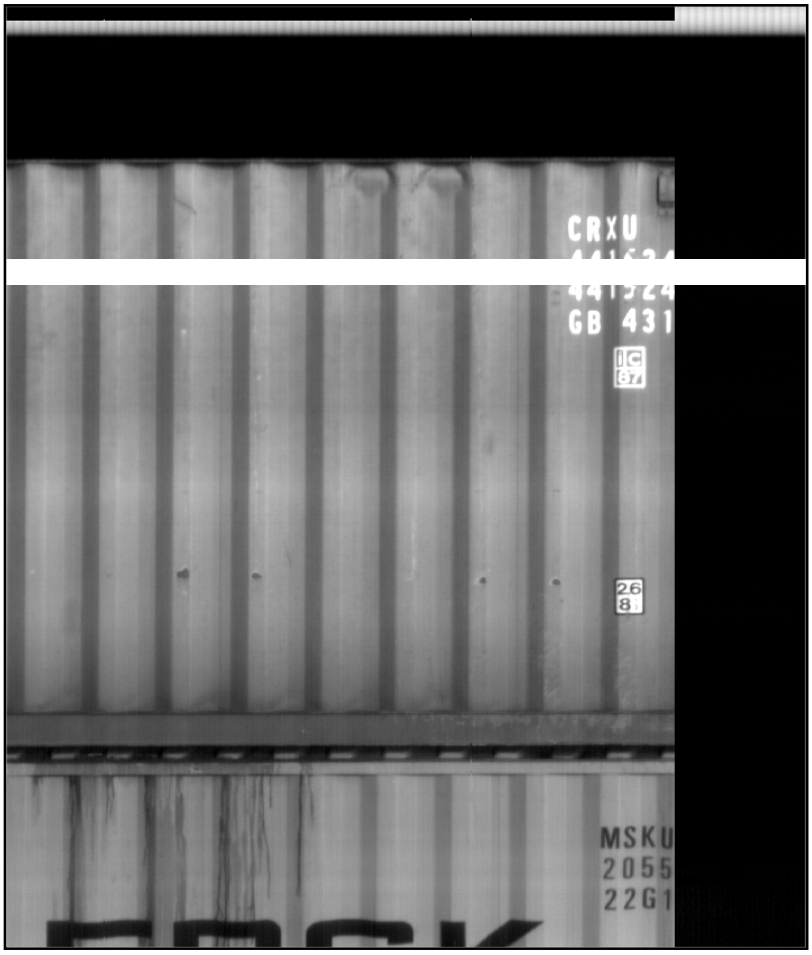

Figure 34 – Stopped frame grabber

Figure 35 shows the timestamps for side 1 and Figure 36 shows the timestamps for side 2. Table 8 shows the difference between the timestamps in Figures 35 and 36.

Table 8 – Difference between timestamps

	Side 1	Side 2	Difference
Timestamp 1	0003683715	0003679839	3876
Timestamp 2	0003695248	0003691375	3873

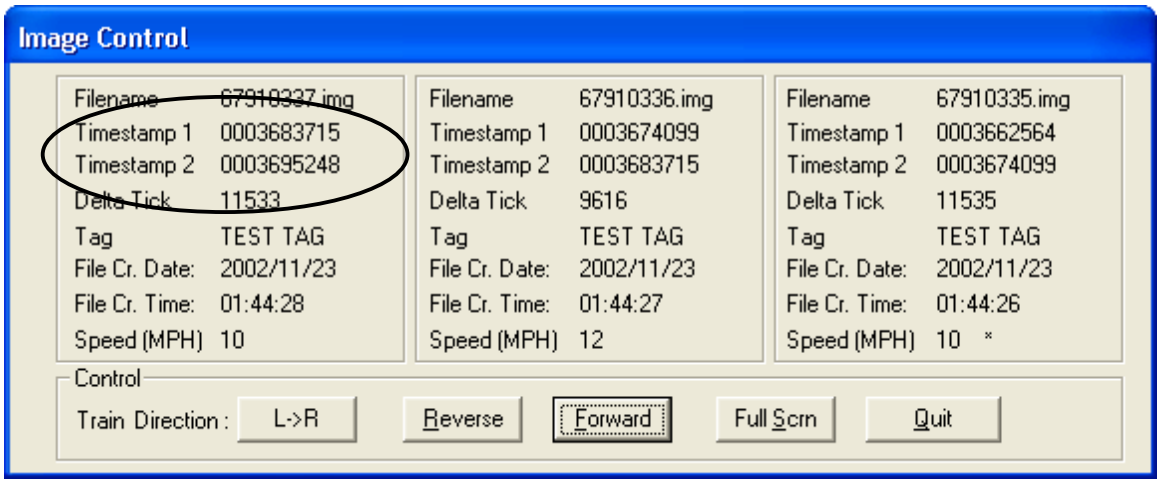

Figure 35 – Timestamps, side 1

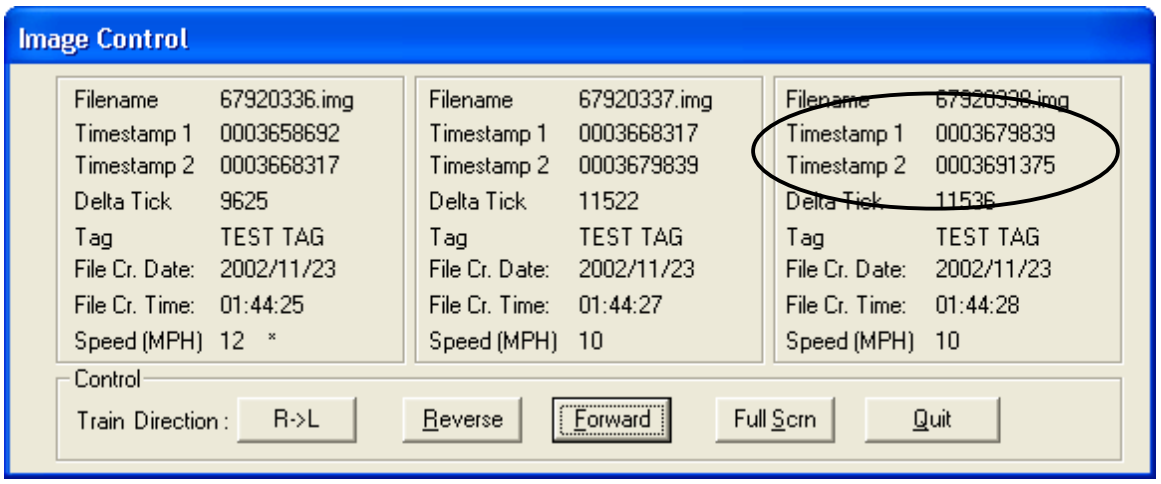

Figure 36 – Timestamps, side 2

Figure 37 shows an example of the glitch problem in an image. Two glitches are in the container number, which can cause a character recognition error.

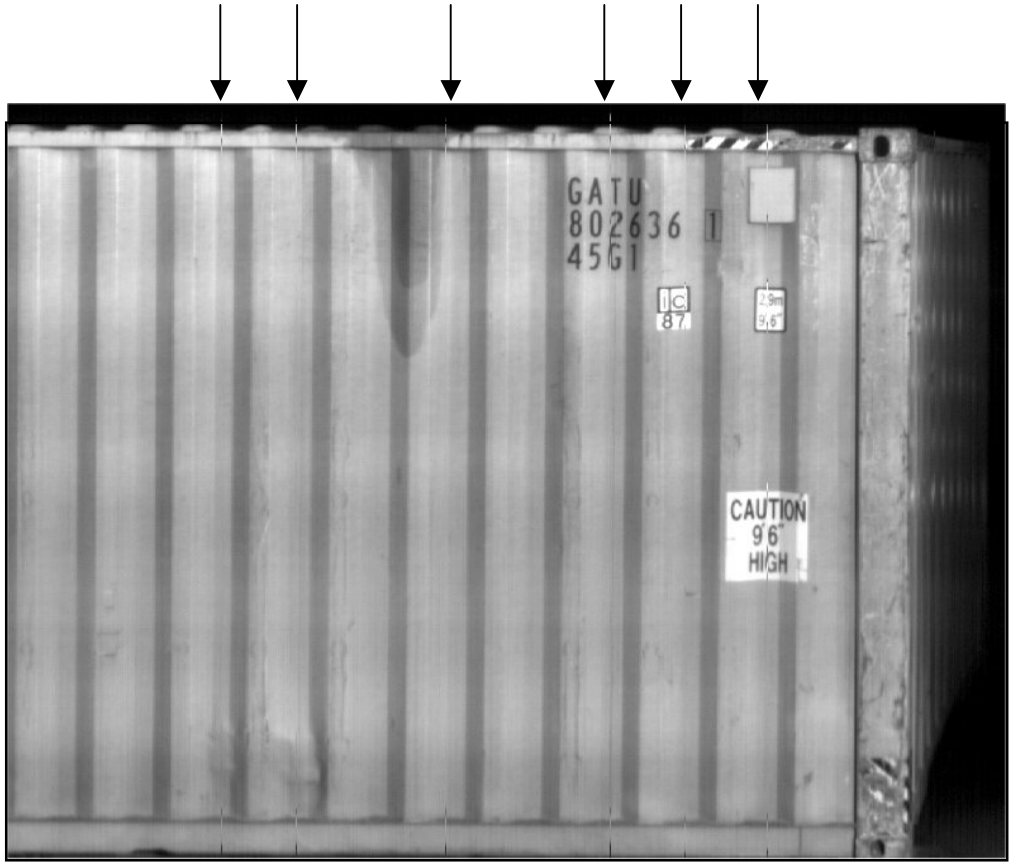

Figure 37 – Example of a glitch

A solution was found to solve these problems: the frame grabber must be replaced with the Matrox Genesis LC card.

4.5 Task 5 – Make Pairing Process More Stable

In the earlier version of INO's OCRail software, the system used the sequence number to perform the image analysis. However, when there was a problem with a frame grabber, the sequence between the two sides was not always the same. With the new version, the OCR software uses the information on the timestamps to pair the images for the two sides. The result is more reliable with the timestamps than with the sequence number since the system uses a precise timestamp for the two sides. By using this method, the OCRail software can pair the two sides correctly even if one of the frame grabbers stops capturing the images temporarily. A difference in the timestamps for side 1 and side 2 that is less than or equal to 1500 units can occur, but this spread is negligible. Note that one unit equals 1/9600 of a second. Figure 38 shows the timestamps for side 1 and Figure 39 shows the timestamps for side 2.

Table 9 – Timestamps with a difference of less than 1500 units

	Side 1	Side 2	Difference
Timestamp 1	0000126464	0000126723	-259
Timestamp 2	0000135456	0000135715	-259

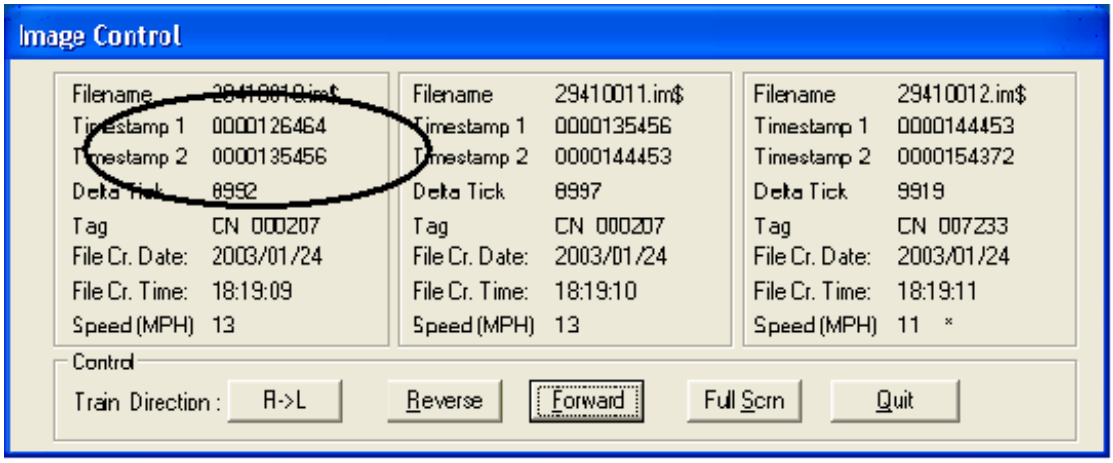

Figure 38 – Timestamps for side 1

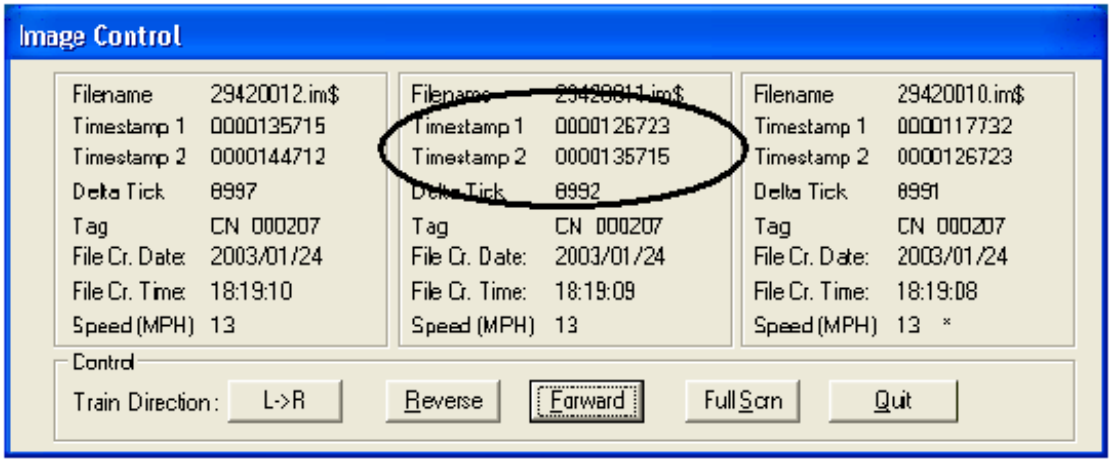

Figure 39 – Timestamps for side 2

INO made a second modification to add the checksum number. In the analysis, if the OCRail cannot recognize the check digit when it compares the two sides, the Corail software will calculate it if it has enough information about the other recognized valid characters. Figure 40 shows an image of a container number with the missing checksum.

Figure 40 – Missing checksum

4.6 Task 6 – Modify LICO Software to Ensure End-of-Train Detection

When a train finished passing, the LICO software did not send a signal to the Corail software to indicate the end of the train. CCTC modified the LICO software so that it always transmits an EoT signal in the last image sent. When a train passes, there are always three images that follow the last wheel detection. If for some reason there are fewer than three images, the system adds a grey image and adds the EoT bit to this last image. If there are more than three images, the system deletes the extra ones so that there are only three images after the last wheel and modifies the last image to add the EoT bit.

After the modifications, checks were run during the preliminary tests and the ends of the trains were shown correctly on each move. The check was done using the container viewing software (viewer.exe) from CCTC. On the Image Control window (Figure 41), the last image can be seen in the Speed (MPH) field. 'CT' means that it is the end of a train.

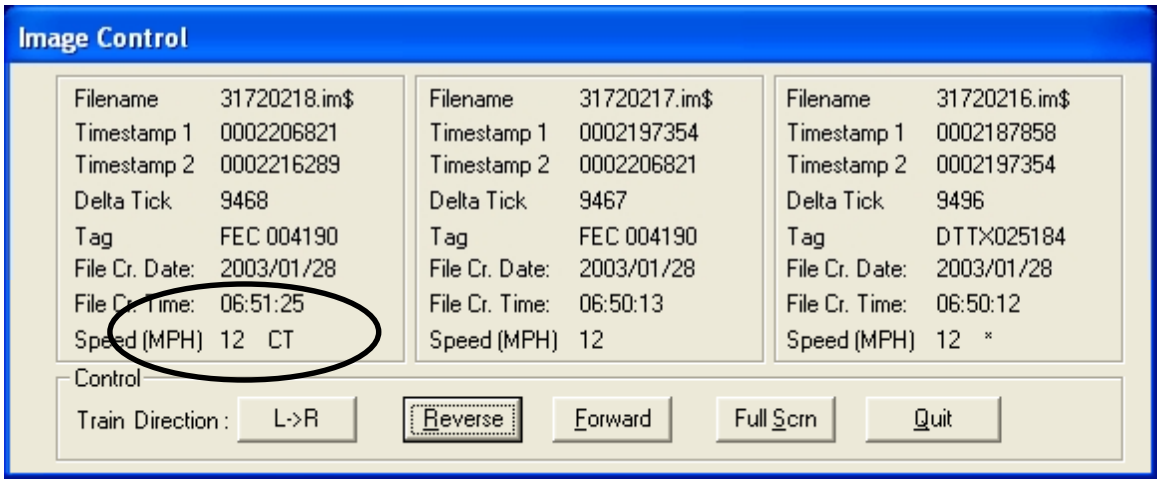

Figure 41 – End-of-train display

4.7 Task 7 – Modify AEI Software to Generate a Results File Every Time

CCTC modified the AEI to generate a results file every time. If the system's east or west sensors detect an object without input from the centre, the system should generate a new move and create an EDI file. Tests were conducted at POM to check whether the system generated a move every time. These tests were successful.

4.8 Task 8 – Update File Containing Company Codes Used by the OCR Program

The OCR program uses a text file containing the Bank Identified Codes (BIC) that, in compliance with the ISO 6346 standard, must be present on each container. The four-letter code is validated against the contents of the text file. The software allows users to keep this file up to date manually by adding new codes and deleting inactive ones. The software is in a simple, user-friendly Graphical User Interface (GUI) format.

The BIC codes are managed on the main screen. Users can enter a BIC code, and the name of the company that owns the container is displayed, if it exists, along with the country and city of origin. All operations for the codes are accessible through small buttons on the toolbar.

The possible operations are:

- Add a new BIC code;
- Delete a BIC code;
- Change the country and/or city of origin of the owner of the container;
- Edit the name of the company that owns the container.

Figure 42 shows the GUI for the software.

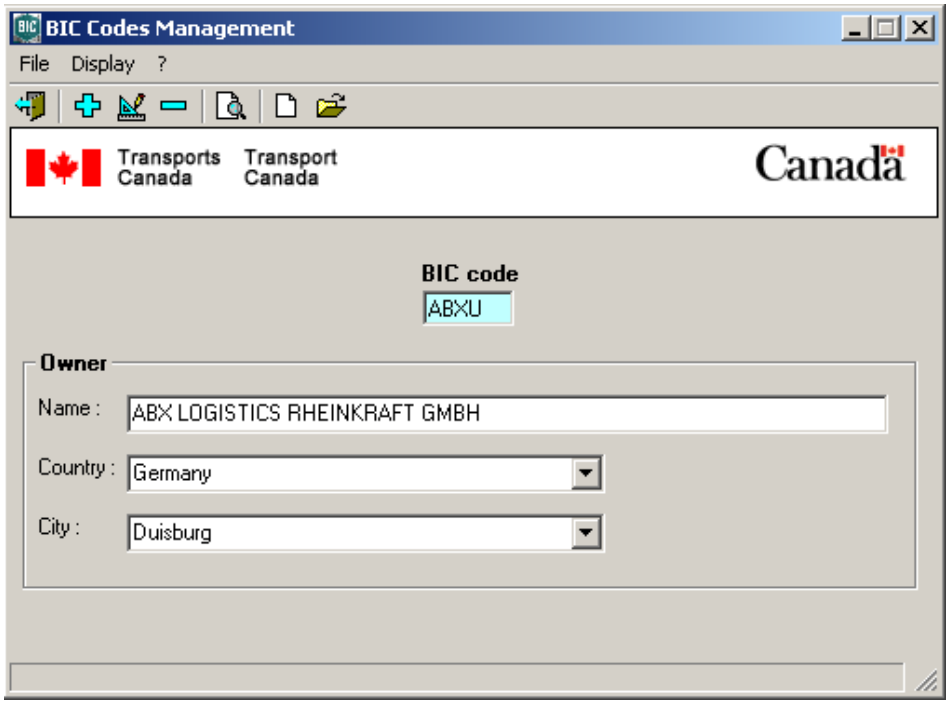

Figure 42 – Graphic environment for BIC code software

A window is provided for viewing the list of all the BIC codes contained in the database. The list is sorted in alphabetical order by code. The information about the owner related to this code is also displayed in this window.

The file of results can be viewed using Microsoft Notepad.

The OCRail software uses the result file to analyse the images. This file is created using the BIC Codes Management software. Every time the database is updated, the results file must also be updated. This file is then placed in directory for the Corail software.

4.9 Task 9 – AEI/OCR System Networking Test

To ensure that the system works properly and to have the best possible transfer rate, the AT switch was fully tested with different configurations. All ports were checked with different combinations. Tests were conducted by transferring 400 files of 1 MB each. Different configurations were tried for the network interface cards by selecting automatic, semi-automatic and full duplex. The best transfer time for these tests was 53 seconds with the network interface cards configured in full duplex. Many other tests resulted in times less than one minute using a full duplex configuration and automatic selection for the cards.

At POM, different tests were conducted to check the transfer time for the following operation: copy the LICO1 file to Corail1, rename the file and then delete the file from its original location. These tests were conducted by simulating the LICO software process. The best result was 48 seconds using a network drive and the second hard drive on the Corail. This hard drive must be the master on the secondary IDE (Integrated Device Electronics) connector.

The recommendations resulting from these tests included the following:

a) Use 3COM 3C-905-TX-M network interface cards.

b) Use network interface cards in full duplex 100 MBps to ensure a good transfer time.

c) Use a second hard drive on the Corail computers to run the application.

d) One hard drive must be installed as a master on the primary IDE channel and the other one must be the master on the secondary IDE channel.

e) Keep the AT switch.

f) Use a minimum of a 1.7 GHz P4 computer for the Corails.

g) Protect the computers against power failures with two APC 1500 SMART-UPS units.

These recommendations were all accepted by TDC and implemented by DTI.

5 AEI / OCR SYSTEM PRELIMINARY TEST

Set-to-work tests or preliminary tests were conducted to finalize the installation set-up, implement final corrective measures and modifications, and prepare the system for the formal acceptance tests. These preparations were carried out for a period of four weeks prior to the formal acceptance tests to ensure that the system had achieved the specified performance in terms of accuracy and data transfer rate.

This work focused on the set-up of the actual system installed at the site. The task was crucial to ensure that the infrastructure comprising the hardware and physical installation were functioning in an optimal fashion and that all system software and hardware improvements had been implemented. These preliminary tests were necessary to verify actual system performance. DTI conducted four weeks of preliminary tests to measure the system's performance and detect any abnormalities. During these tests, it was essential that the infrastructure and necessary elements of the installed system functioned correctly and within the design specification.

To assure successful completion of the formal acceptance tests, DTI's role included the following activities:

- Plan and execute the preliminary test cases.
- Supervise and co-ordinate preliminary tests on site.
- Compile, analyse and publish results.
- Make recommendations and implement corrective measures.

5.1 Week 1 – November 3rd to 9th 2002

In the first week of tests, the frequent frame grabber problems showed that the results obtained could be greatly improved by replacing the frame grabbers with Matrox cards. In addition, glitches appeared in the images – and occasionally in a container code – and hindered analysis of the image.

During the test week from November 3rd to 9th 2002, 73 train moves were observed. Eighteen of the 73 trains had containers. All the trains were analysed.

Table 10 provides a classification of these moves for week 1.

Table 10 – Classification of observed moves

Type of train	# of trains	%
Simulation	0	0.00
Empty move	15	20.55
Locomotive only	21	28.77
Train without containers	3	4.11
Train with containers	18	24.66
Freight train	16	21.92
Total # of trains	73	100.00

Table 11 presents the information for these moves generated by the AEI station during the first week of tests.

Table 11 – Move information (week 1)

Results

The success rate for all the containers was 83.84%.
Table 12 presents the OCR accuracy results for the first week of tests.

The minimum success rate that must be obtained to meet POM requirements is 80%. For week 1, the success rate for valid containers was 89.99%.

	Mean Accuracy/valid cont. C2	69,90%

Modifications

Modifications had to be made to solve the following problems:

1) Failure of the frame grabbers
A sequence of images would be missing on one of the sides, depending on which frame grabber failed. The frame grabbers had to be changed to solve this frequent failure problem. The new frame grabber chosen was the Matrox Genesis-LC 3000 card, based on the recommendation of INO, which used this technology with success. The Matrox card was installed on the LICO1 and LICO2 at POM on January 16th 2003 by CCTC.

2) Glitch on the images
Glitches were present on the images and hindered character recognition. The LININT boards on the LICO1 and LICO2 had to be checked because some components appeared to be faulty. The LININT master was changed on December 13th 2002 and the LININT slave components were replaced on January 16th 2003 with the old LININT master components.
There were two major types of problems with the image analysis:

- Lines missing on one or both sides of the convoy of containers (Figure 43) is resulted in a loss of the images for part of a container or for many containers. The reading of the ISO code of the container, as well as the positioning of its end, became impossible, which results in a bad pairing of the codes on both sides of the containers during the last processing of the OCR program.

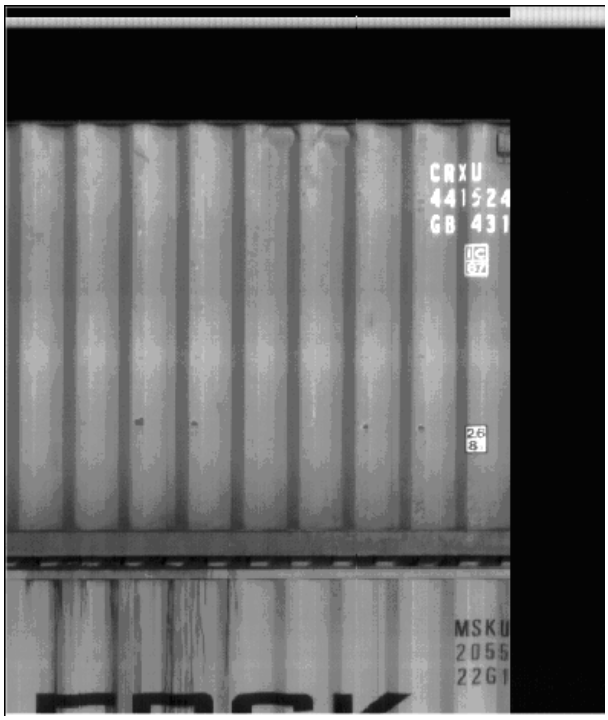

Figure 43- Failure of the frame grabbers

- Image lines with pixels that start with a 1-to-12-pixels downward shift (Figure 44), this resulted in a modification of the numbers and letters of the ISO code written on the container, which made the interpretation less precise, thus reducing the OCR program efficiency.

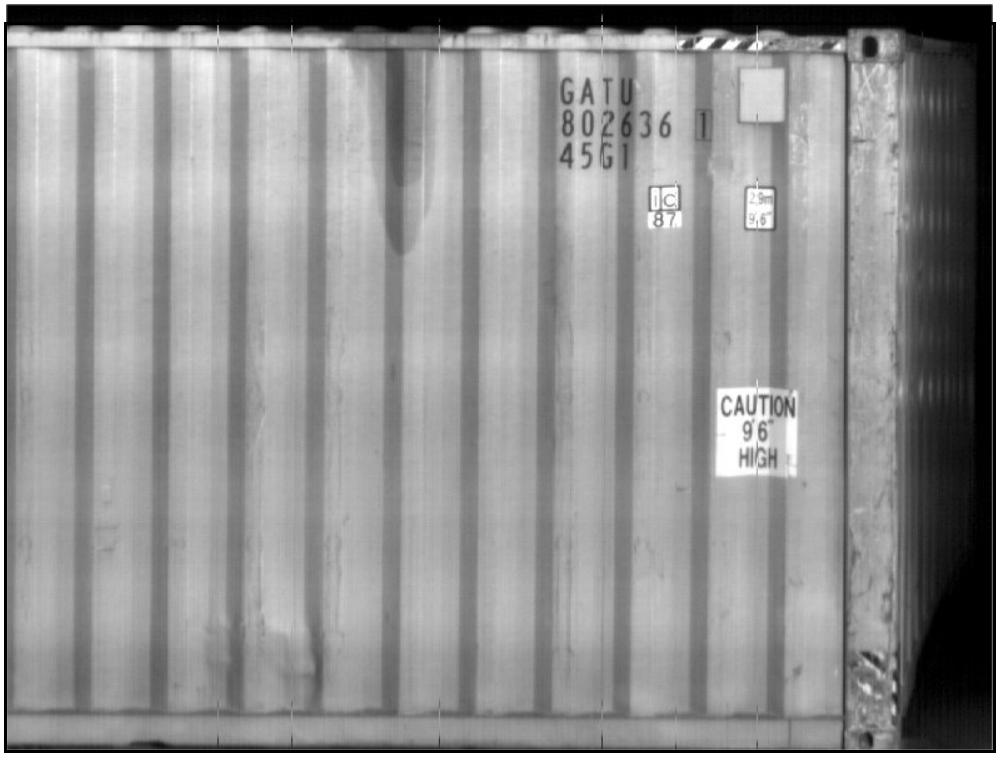

Figure 44 – Glitches on the image

3) *Difference between the timestamps for the two sides*
The timestamps for the two sides showed a difference of more than 1,500 units. Changing the Matrox cards and the LININT boards solved the problem.

5.2 Week 2 – February 23rd to March 1st 2003

The problems encountered in the first week were not present during this week of tests. The failure of the frame grabbers, the glitches on the images and the difference between the timestamps were solved before the second week of tests started.

In week 2, some minor adjustments were done, such as aligning a target and adjusting the intensity.

During the test week from February 23rd to March 1st 2003, 64 train moves were observed. Eleven of the 64 trains had containers. All the trains were analysed by DTI.

Table 13 provides a classification of these moves for week 2.

Table 13 – Classification of observed moves (week 2)

Type of train	# of trains	%
Simulation	2	3.13
Empty move	18	28.13
Locomotive only	17	26.56
Train without containers	0	0.00
Train with containers	11	17.19
Freight train	16	25.00
Total # of trains	64	100.00

Table 14 presents the information for these moves generated by the AEI station during the second week of tests.

Results

Table 15 presents the OCR accuracy results for the second week of tests.

The minimum success rate that must be obtained to meet POM requirements is 80%. For week 2, the success rate for valid containers was 65.05%.

The success rate for all the containers was 57.18%.

Table 15 – Accuracy rate on moves with containers (week 2)

Move 604, 617 : Barber post was too dark on side 2. INO modified the OCR program and sent a new version to DTI, February 29, 2003.
Move 616 : Many speed variations from 0 to 12 and 12 to 0. The average speed was 7. TC64 did not adjust the capture of the images as fast to follow the variation of that train.
Move 628, 640 : The bottom lightbeams did not cut after the loco until the end of train. This lightbeam needed a new alignment.
Move 659 : The OCR program had some difficulties correctly identifying the letters, MWCU and GLDU. INO sent a new version of OCRail, March 12, 2003.

									Number of moves :		11	
									Respect of criterias :		9	
									Process time performance :		**81,82%**	

All the train moves had a processing time of less than 20 minutes as required by POM, except for two moves. Move 616 took 00:20:54 to pass the site and move 628 took 00:20:32.

Modifications

Modifications had to be made to solve the following problems:

1) Target aligned incorrectly on side 2
The target on side 2 was aligned incorrectly, which made the images black. CCTC realigned the target and reduced the intensity on side 2 on February 24th 2003.

2) Intensity too strong on side 1
The intensity on side 1 was too strong, resulting in characters that were too white and illegible. CCTC reduce the intensity on side 1, which improved the quality of the images, on February 25th 2003.

3) Analysis problem with the OCRail software
The method for pairing the timestamps did not work properly. INO improved the timestamp-pairing algorithm on February 27th 2003, and DTI installed it at POM on February 28th 2003.

5.3 Week 3 – March 2nd to 8th 2003

The problems encountered in the second week of tests, such as the adjustment of the target and intensity of side 2, and the improvement in the timestamp pairing method, were solved before week 3 started.

During the test week from March 2nd to 8th 2003, 64 train moves were observed. Fourteen of the 64 trains had containers. All the trains were analysed by DTI.

Table 17 provides a classification of these moves for week 3.

Table 17 – Classification of observed moves (week 3)

Type of train	# of trains	%
Simulation	0	0.00
Empty move	6	9.38
Locomotive only	20	31.25
Train without containers	0	0.00
Train with containers	14	21.88
Freight train	24	37.50
Total # of trains	64	100.00

Table 18 presents the information for these moves generated by the AEI station during the third week of tests.

Table 18 – Move information (week 3)

Weather conditions

During this test week, four days of snow and one day of rain were reported. The days with snow did not have any effect on the quality of the images. The cold and the rain did not have any effect on the performance of the external equipment.

Table 19 – Weather conditions (week 3)

Results

Table 20 provides the OCR accuracy results for the third week of tests.

The minimum success rate that must be obtained to meet POM requirements is 80%. For week 3, the success rate for valid containers was 87.00%.

The success rate for all the containers was 79.84%.

Table 20 – Accuracy rate on moves with containers (week 3)

Table 21 provides the processing times for the train moves that were analysed during the third week of tests.

Several train moves had processing times exceeding 20 minutes. Moves 692, 728 and 729 had a problem with the OCRail application, which stopped during analysis. Move 718 had a processing time of 00:58:11 because there was a problem with the AEI.

Table 21 – Processing times (week 3)

										Number of moves :	14		
										Respect of criterias :	10		
										Process time performance :	**71,43%**		

*** These three moves do not meet the requirement. We identified a problem with the OCRail program, which occasionnaly stopped in the middle of the move for no specific reason. INO made a modification to the OCRail program and sent the new executable to DTI. DTI installed a new version of OCRail at POM, March 11, 2003.**

**** Two moves with the same move time.**

Modifications

Modifications had to be made to solve the following problems:

1) Failure of the OCRail application
The OCRail application failed during a train move for no apparent reason. INO is currently working on this problem, and no correction had been made by March 31st 2003. This problem should be resolved in a subsequent phase.

2) Identical direction on both sides
Both ICR files had an identical direction bit. This problem caused a duplication of recognized characters and a pairing problem. The direction bit in the ICR file was determined by the fifth image read, and not by the last image of the first group of files received by the Corails. INO modified the software on March 10th 2003, and DTI installed the new version at POM on March 11th 2003.

5.4 Week 4 – March 9th to 15th 2003

The problem involving the identical direction was solved before the fourth week of tests started. The failure of the OCRail application could not be solved before this week of tests, but INO is currently working on the problem.

During the test week from March 9th to 15th 2003, 72 train moves were observed. Twelve of the 72 trains had containers. All the trains were analysed by DTI.

Table 22 provides a classification of these moves for week 4.

Table 22 – Classification of observed moves (week 4)

Type of train	# of trains	%
Simulation	0	0.00
Empty move	20	27.78
Locomotive only	16	22.22
Train without containers	0	0.00
Train with containers	12	16.67
Freight train	24	33.33
Total # of trains	72	100.00

Table 23 presents the information for these moves generated by the AEI station during the fourth week of tests.

Table 23 – Move information (week 4)

Weather conditions

During this test week, the temperatures were good and no snow precipitation was reported. The coldest temperature was -17°C, which did not cause any problems with the external equipment.

Results

Table 25 provides the OCR accuracy results for the fourth week of tests.

The minimum success rate that must be obtained to meet POM requirements is 80%. For week 4, the success rate for valid containers was 84.59%.

The success rate for all the containers was 73.34%.

Table 25 – Accuracy rate on moves with containers (week 4)

Move 737 : MWCU problem identification. INO sent a new version of the OCR program to DTI, March 11, 2003.
Move 761, 762 : OCR proplem to determine the direction of the train. INO sent a new version of the OCR program to DTI, March 11, 2003.
Move 785 : Many speed variations from 0 to 11 ans 11 to 0. The average speed was 8. TC64 did not adjust the capture of the images as fasto follow the variation of that train.

Table 26 provides the processing times for the moves that were analysed during the fourth week of tests.

Four train moves had processing times exceeding 20 minutes. Moves 746 and 747 had a time of 01:00:25 and 01:03:26 because the OCRail application failed on both Corails. Move 786 had a time of 00:23:45 because the move duration was 00:21:01. It is impossible to have a processing time that is less than the time it takes for a train to pass. Move 808 had a processing time of 00:20:50 because there was no EoT.

Table 26 – Processing times (week 4)

Modifications

Modifications had to be made to solve the following problems:

1) Double moves with the same time
Several train moves appeared twice. The wheel sensors were checked, and the east wheel sensor was found to be defective. Wheel sensor F1 was replaced, and F1 and F2 were adjusted on March 19th 2003 by CCTC.

2) GLDU codes were identified incorrectly
The codes starting with GLDU were being identified as GLOU. INO modified the OCRail software on March 10th 2003, so that when a code was detected as GLOU but with a check digit that matched a GLDU code, the code would be replaced with the correct one. DTI installed the new version at POM on March 11th 2003.

3) MWCU codes were identified incorrectly
The MWCU codes were being identified incorrectly as MJCU, MUCU, MVCU, MZCU, UJCU, UUCU, UVCU, VJCU, VUCU, VVCU and WVCU. INO had modified the OCRail software on March 12th 2003, so that when a code was detected as MJCU, MUCU, MVCU, MZCU, UJCU, UUCU, UVCU, VJCU, VUCU, VVCU or WVCU but with a check digit that matched a MWCU code, the code would be replaced with the correct one. DTI installed the new version at POM on March 14th 2003.

4) MAEU codes were identified incorrectly
The MAEU codes were being identified incorrectly as AAEU. INO modified the OCRail software on March 12th so that when a code was detected as AAEU but with a check digit that matched a MAEU code, the code would be replaced with the correct one. DTI installed the new version at POM on March 14th 2003.

5) Bulkhead platform cars were not detected

When several containers passed on a bulkhead platform car, the OCRail software only managed to detect the first one because there was not enough space between each platform. INO modified the OCRail software on March 11th 2003 to make it more sensitive to these spaces when detecting containers. DTI installed the new version at POM on the same day.

6 AEI/OCR SYSTEM ACCEPTANCE TESTS

Final acceptance tests were carried out after the AEI/OCR system performance parameters had been met and demonstrated in the preliminary tests. DTI then performed operational and performance tests to formally demonstrate the performance specified in the contract. The tests were performed over a fixed duration of two weeks. DTI prepared an acceptance test plan and test procedures, and identified the acceptance test criteria, test environment and pass/fail criteria. The test results were compared to the test acceptance criteria to show whether the tested requirement was met.

The acceptance tests were performed on a fully integrated system to demonstrate the compatibility, functionality and performance of the AEI/OCR system. This activity consisted of two weeks of acceptance tests to measure the system's final performance. Data was collected, compiled and analysed every workday.

The acceptance tests took place from 00:01 a.m. on March 16th 2003 to 23:59 p.m. on March 29th 2003 at a site located near elevator no. 5 at POM.

6.1.1 Revised Architecture of AEI/OCR System

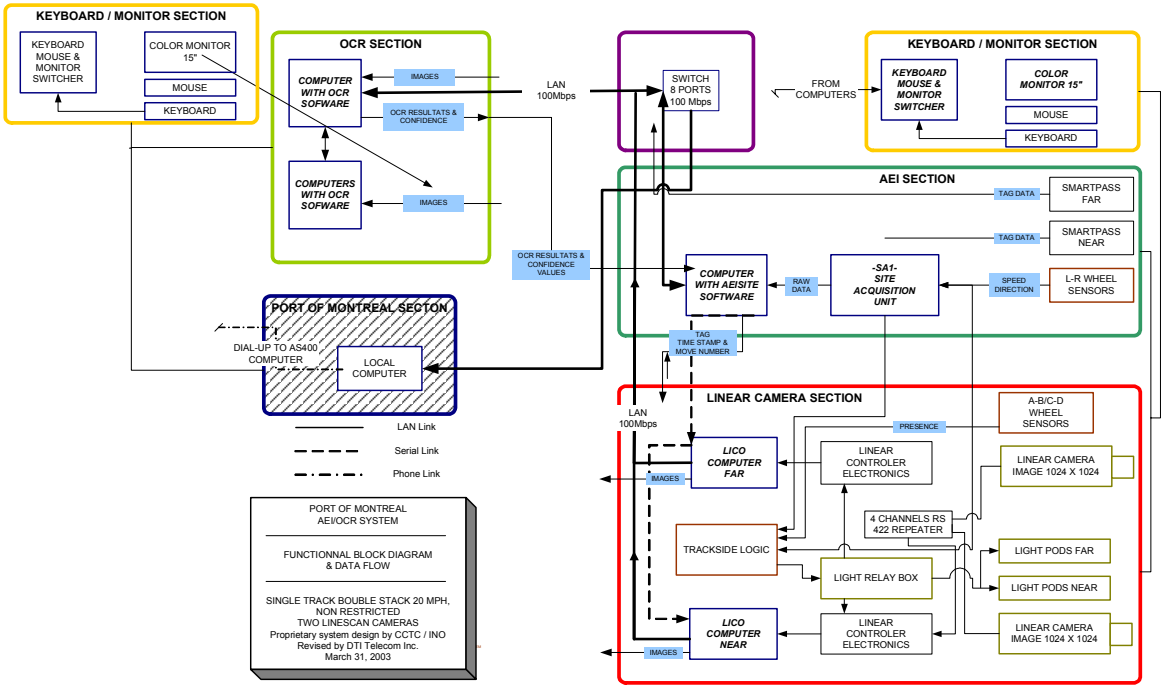

Figure 46– Plan of revised architecture

6.1.2 Reviewed LAN Topology

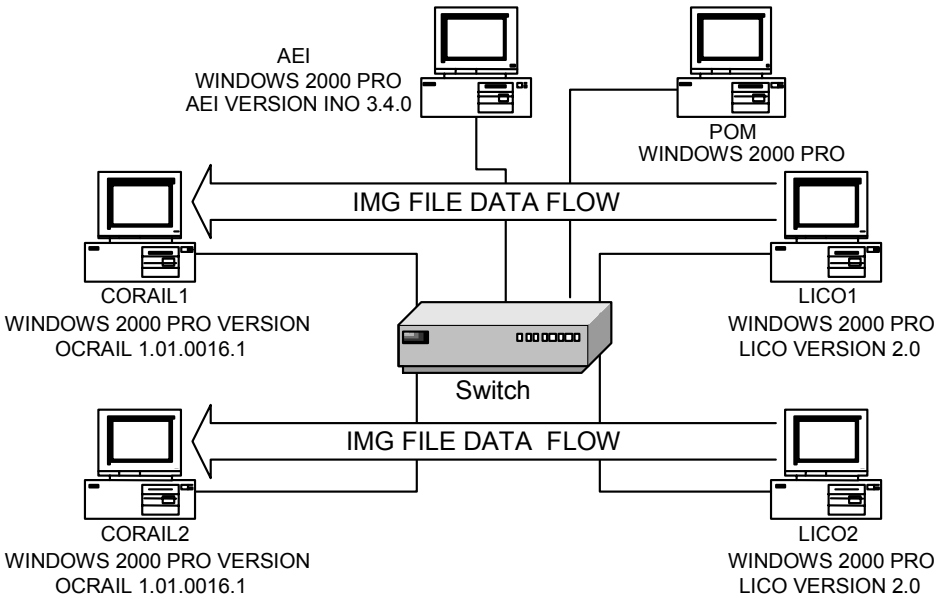

Figure 47 – Plan of new topology

6.1.3 Description of Changes Introduced to System

The following is a list of approved changes made to the system configuration (dated January 2003):

1. New hardware configuration for all personal computers;
2. Upgrade of the operating system for all computers to MS-Windows 2000 Pro;
3. 3COM network interface card on all computers;
4. Hard drive defragmentation software on all computers;
5. Two hard drives on each Corail station (the second one is only used to run the OCR application software);
6. Two new 1.5-kVA UPSs.

6.2 Control Process During the Test Period at POM Site

The acceptance tests were supervised by DTI with the ad hoc collaboration of CCTC.

Since POM had deactivated all telephone lines connected to the site, DTI visited the site on the morning of each business day to verify the condition of the system/hardware and collect the previous day's data.

DTI requested CCTC's help to solve a wheel sensor problem. DTI also requested INO's help to solve a minor OCR problem during the first week of the acceptance tests.

6.3 Weather Conditions

Table 27 summarizes the weather conditions observed at Montreal's Dorval Airport during this period and presents them by time slot.

Table 27 – Weather conditions (by time slot)

DATE	HOUR	WIND AVERAGE SPEED (KM/H)	TEMP. (C)	HUMIDITY (%)	SKY
2003-03-16	06H-12H	10,86	-4	67,28	Variable cloudiness

	13H-19H	20,29	6,57	48,86	Variable cloudiness
	20H-05H	6,75	2,11	59,44	Variable cloudiness
2003-03-28	06H-12H	17	1,33	56,33	Cloudy
	13H-19H	14,5	9,33	51,17	Variable cloudiness
	20H-05H	26,8	10,2	51,8	Variable cloudiness
2003-03-29	06H-12H	26,13	11,75	71,75	Cloudy
	13H-19H	25,57	8,57	81,14	Showers
	20H-12H	21,4	5,2	66,2	Cloudy

The tests were conducted under winter conditions, according to the data collected, during the last two weeks of March 2003. Environment Canada (Dorval) recorded precipitation on only four days out of a total of 14. Moreover, during this period, the majority of each day was cloudy or partially cloudy. There were only two days with a clear sky during this period.

The average temperatures recorded during this period ranged from a minimum of -7°C to a maximum of 14°C.

To summarize, the weather was relatively clement and had little impact of the containers, the installer equipment, or the images captured by the cameras.

6.4 Trains Observed

During the test period, 116 train moves were observed (from 809 to 927). Table 28 provides a classification of these moves.

Table 28 – Classification of observed moves (acceptance tests)

Type of train	# of trains	%
Simulation	2	1.72
Empty move	26	22.41
Locomotive only	21	18.10
Train without containers	0	0.00
Train with containers	26	22.41
Freight train	41	35.34
Total # of trains	116	100.00

The 26 trains with containers (or 22.41% of the observed moves) were used in the character recognition accuracy analysis.

Table 29 presents the information for these moves generated by the AEI station during the test period and the comments on the type of move observed.

Twenty-six of these moves were identified as empty ones. Some of these moves were probably initiated by the inadvertent activation of the wheel sensors. An investigation is required to determine the problem and find a suitable solution.

Table 29 – Move information (acceptance tests)

Table 30 presents the chronology of the events that occurred during the test period and the actions taken regarding these events.

Table 30 – Events during acceptance test period

DATE	EVENTS	ACTIONS TAKEN
March 19th	Double move with same time	Replacement of east wheel sensor F1 and adjustment of F1 and F2.
March 21st	PONU codes were incorrect	INO sent a new version of OCRail software, which DTI installed.
March 25th	OCR program stopped for no reason	INO sent a new version to provide more information in the log file. DTI installed this new version at POM.

6.5 Week 1 of Acceptance Tests – March 16th to 22nd 2003

During the test week from March 16th to 22nd 2003, 56 train moves were observed. Twelve of the 56 trains had containers. All the trains were analysed.

Table 31 provides a classification of these moves for week 1.

Table 31 – Classification of observed moves (week 1 of acceptance tests)

Type of train	# of trains	%
Simulation	0	0.00
Empty move	15	26.79
Locomotive only	10	17.86
Train without containers	0	0.00
Train with containers	12	21.43
Freight train	19	33.93
Total # of trains	56	100.00

Table 32 presents the information for these moves generated by the AEI station during the first week of acceptance tests.

Results

Table 34 presents the OCR accuracy results for the first week of acceptance tests.

The minimum success rate that must be obtained to meet POM requirements is 80%. For the first week of acceptance tests, the success rate for valid containers was 91.76%.

The success rate for all the containers was 89.17%.

Table 34 – Accuracy rate on moves with containers (week 1 of acceptance tests)

Table 35 shows the processing times for the moves that were analysed during the first week of acceptance tests.

Three train moves had processing times exceeding 20 minutes. Moves 842 and 850 had a problem involving the failure of the OCRail program, and move 858 had a duration of 00:27:15.

Modifications

Modifications had to be made to solve the following problems:

1) PONU codes were entered incorrectly
The OCRail software did not detect the PONU codes correctly. INO modified the OCRail software on March 20th 2003, so that an error in the PONU code would be corrected automatically.

2) Defective wheel sensor
East wheel sensor F1 was defective and caused double train moves with the same time. Wheel sensor F1 was replaced, and F1 and F2 were adjusted on March 19th 2003 by CCTC.

6.6 Week 2 of Acceptance Tests – March 23rd to 29th 2003

During the test week from March 23rd to 29th 2003, 59 train moves were observed. Fourteen of the 59 trains had containers. All the trains were analysed.

Table 36 provides a classification of these moves for week 2.

Table 36 – Classification of observed moves (week 2 of acceptance tests)

Type of train	# of trains	%
Simulation	0	0.00
Empty move	12	20.34
Locomotive only	11	18.64
Train without containers	0	0.00
Train with containers	14	23.73
Freight train	22	37.29
Total # of trains	59	100.00

Table 37 presents the information for these moves generated by the AEI station during the second week of acceptance tests.

Weather conditions

The weather conditions for this week did not have any effect on the analysis of the images or the external equipment.

Table 38 – Weather conditions (week 2 of acceptance tests)

Day	Date	Time	Celsius	Winds (km/h)	Wind factor	Climate
Sunday	March 23rd 2003	07:00:00	1	9		Rain
Sunday	March 23rd 2003	16:00:00	4	7		Cloudy
Monday	March 24th 2003	07:00:00	1	7		Sunny with clouds
Monday	March 24th 2003	16:00:00	8	9		Sunny with clouds
Tuesday	March 25th 2003	07:00:00	4	17		Cloudy
Tuesday	March 25th 2003	16:00:00	7	13		Rain
Wednesday	March 26th 2003	07:00:00	3	11		Rain
Wednesday	March 26th 2003	16:00:00	8	15		Sunny with clouds
Thursday	March 27th 2003	07:00:00	1	17	-4	Sunny with clouds
Thursday	March 27th 2003	16:00:00	7	22		Sunny with clouds
Friday	March 28th 2003	07:00:00	1	19	-4	Cloudy
Friday	March 28th 2003	16:00:00	10	15		Sunny with clouds
Saturday	March 29th 2003	07:00:00	11	24		Cloudy
Saturday	March 29th 2003	16:00:00	9	34		Rain

Results

Table 39 presents the OCR accuracy results for the second week of acceptance tests.

The minimum success rate that must be obtained to meet POM requirements is 80%. For the second week of acceptance tests, the success rate for valid containers was 90.80%.

The success rate for all the containers was 86.46%.

Table 39 – Accuracy rate on moves with containers (week 2 of acceptance tests)

Table 40 shows the processing times for the moves that were analysed during the second week of acceptance tests.

Four train moves had processing times exceeding 20 minutes. Moves 869 and 888 had move duration of 00:35:10 and 00:32:37. The false detection for moves 903 and 911 had no EoT and no images.

Table 40 – Processing times (week 2 of acceptance tests)

Modifications

Modifications had to be made to solve the following problems:

1) Failure of the OCRail application
The OCRail software stopped during analysis. During the daily inspection, it was noticed that the OCRail program had stopped on computers Corail1 and Corail2. There was no indication of the origin of the shutdown in the OCRail's log file, which contains system diagnostics and trace logs. The computers were still on, and no electrical power loss had been reported.

DTI asked INO to investigate and determine the cause of the problem, which seemed intermittent. INO and DTI tried to reproduce the shutdown of the OCRail program but to no avail. INO tried a "burn test", but this test did not result in an unexplainable shutdown.

The source of the error did not seem to be the software, and the problem itself occurs too randomly to permit the finding of a common factor that would lead to the solution. It could be a conflict between software and hardware, or a problem with the hardware components of the computer.

INO had to modify the software to try to solve the problem. No correction had been done by March 31st 2003.

2) Excessive processing time
When a false detection occurred, the LICOs did not create the two grey images for the start and end of the train, as they should have. The OCRail software did not receive any images from the LICOs and thus could not send the ICR file to the AEI station for processing. The AEI then waited 45 minutes before creating the EDI file and transmitting it to POM.

In a situation where no images are created, the AEI software has to be modified to reduce the EDI file creation and transfer time so that processing takes less than 20 minutes. No correction had been done by March 31st 2003.

7 ADDITIONS MODIFICATIONS CARRIED OUT DURING THE TRIALS

7.1 Dimmers – Camera Target Lights

Initially, only one dimmer was used to adjust the target lights that set the camera lens apertures. It was not possible to adjust only one side without affecting the other. This problem occurred frequently when adjustments were made, and limited the quality of the images.

A second dimmer was thus installed, making it possible to adjust side 1 without affecting side 2 and vice versa. CCTC made this modification on September 11th 2002 at POM. The dual dimmer installation works very well, and both sides can now be adjusted independently. Figure 48 shows the two dimmers in place.

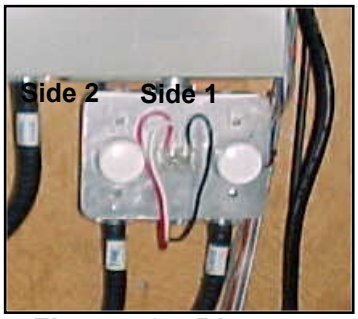

Figure 48 – Dimmers

7.2 Container Detectors – Light Pods ON and OFF

When locomotives passed by, the lights blinded the conductors. It was impossible to turn on the lights until a correction acceptable to Canadian National Railway (CN) was implemented. Consequently, the way the lights turn on and off was modified.

Initially, the lights turned on when an east, west or centre sensor was detected. With the new system, when a train enters the detection circuit, the lights remain off until the AEI detects an RF tag on a car. The lights are then turned on.

When the train is engaged and the lights are already on, they will go off if the program detects a locomotive RF tag or after the train has passed. Figure 49 shows the modification made to the solid state relay box by CCTC.

Figure 49 – Modification done

Subsequent to this modification and a two-week test period, POM and CN did not receive any complaints about the lights. This system has been in operation since August 19th 2002. Figure 51 shows the final results of this modification.

Figure 50 – Before modifications

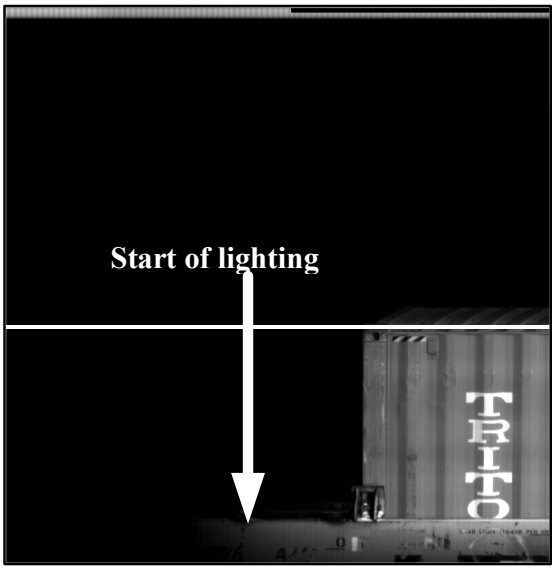

Figure 51 – After modifications

7.3 Container Detectors – Light Beams ON and OFF

When a train passed by, the container detection picked up the locomotive RF tags. The OCRail software then tried to find a code for an object that was actually the locomotive. This problem resulted in the detection of an incorrect code and reduced the effectiveness of the system.

CCTC made a change to activate the detection of containers only once the first RF tag for a railway car had passed, thereby eliminating the false detection of a locomotive.

A 10A relay was added to the solid state relay box on November 27th 2002 (see Figure 52). This relay is responsible for detecting the containers.

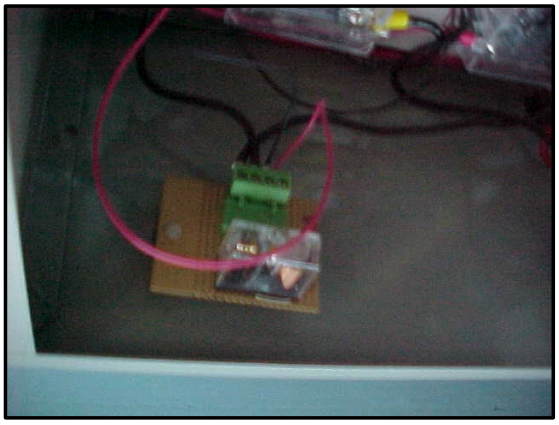

Figure 52 – Container detection

In the LICO software, the light beam signal is only sent once a railway car RF tag has been read. Figures 53 and 54 show the light beams before the modifications.

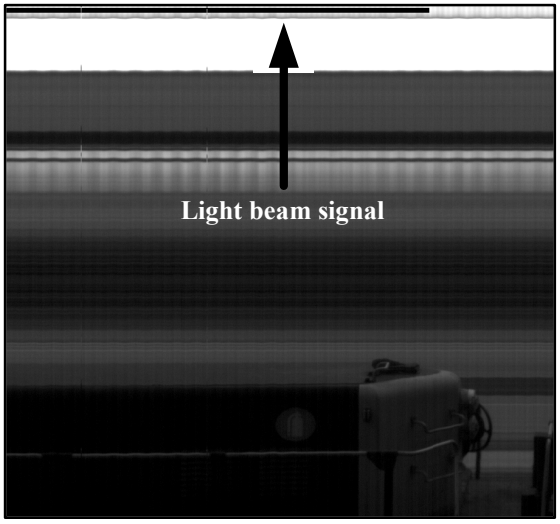

Figure 53 – Locomotive before modifications

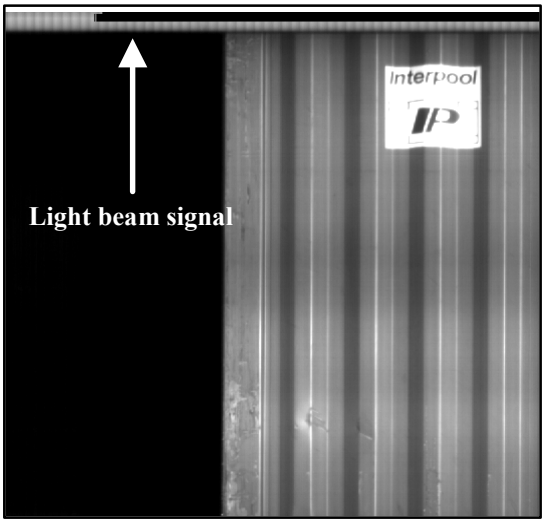

Figure 54 – Container before modifications

Figures 55 and 56 show the final result when a locomotive and a container pass by. Note that the locomotive does not appear on the image because the lights do not turn on subsequent to the modification involving the container detectors (see section 7.2).

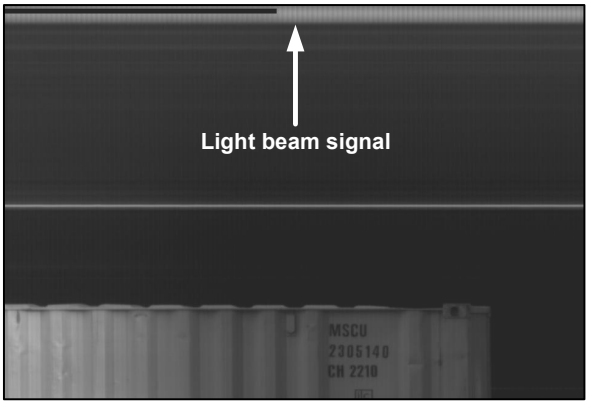

Figure 55 – Locomotive after modifications

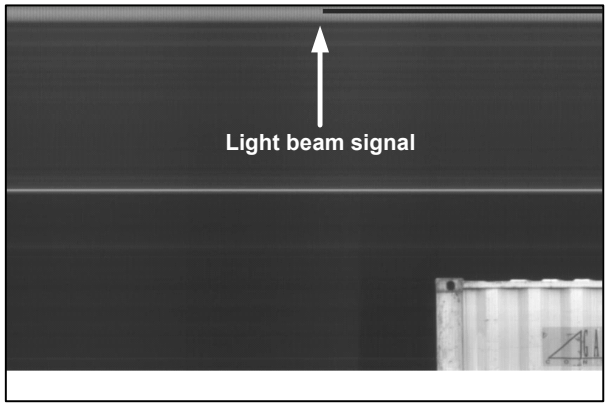

Figure 56 – Container after modifications

7.4 Light Pod Fixture Replacement

The light fixtures that supported the light pods were replaced by CCTC on May 22nd and 23rd 2002 because of the corrosion of the parts.

Figure 57 – Light pods before modifications

Figure 58 – Light pods after modifications

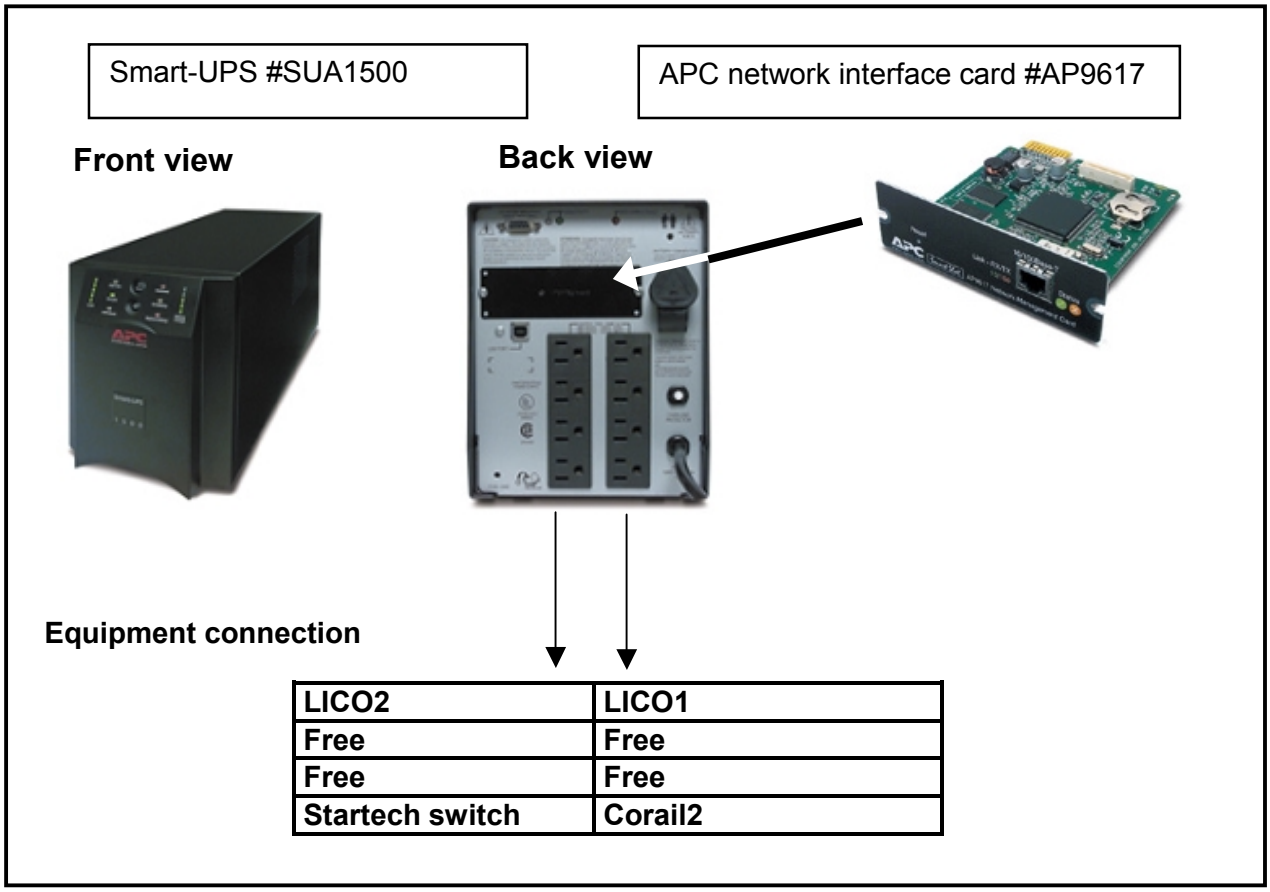
7.5 Wheel Sensor Replacement

When the wheel sensor was moved (see section 4.1.6), one of the sensors was found to be defective. The east wheel sensor was replaced on August 14th 2002. Tests were conducted on the same day to ensure it operated properly. Figure 59 shows the new sensor in place.

Figure 59 – New east sensor

7.6 UPS

A second UPS was installed in the bungalow on June 12th 2002 to enable all the computers to be protected and to keep the system operational during power failures so that the image analysis could be completed. The Corail2, LICO1 and LICO2 computers are connected to it, as well as the Startech switch for the right monitor. Figure 60 shows the UPS and its connections.



LICO2	LICO1
Free	Free
Free	Free
Startech switch	Corail2

Figure 60 – UPS and equipment connections

7.6.1 Configuration of APC Network Interface Card

This network interface card makes it possible to shut down several computers at the same time, using the network in place. It is also used by the computers to communicate with the Smart-UPS for the UPS shutdown configurations (see Table 41).

Table 41 – UPS configuration

Configuration	Value
On-Battery shutdown behaviour	Return on line return
Return battery capacity	0%
Low-Battery duration	5 minutes
Shutdown delay	90 seconds
Return delay	180 seconds

On-Battery shutdown behaviour means that the UPS will start operating again when the power is restored.

Return battery capacity defines the minimum capacity required from the battery for the UPS to be able to restart after a shutdown caused by a power failure.

Low-Battery duration defines the time interval that the UPS will continue to run on battery power when the battery is low.

Shutdown delay defines the time interval before the UPS stops operating in response to a shutdown command.

Return delay defines the time interval before the UPS can restart after a shutdown caused by a power failure.

7.6.2 Workstation Configuration

The workstations were configured separately according to their task and the UPS's operating time. The first option tells the computer to shut down in the case of a power failure. The second option tells the computer when it must shut down after a power failure. The third option tells the computer whether it is responsible for putting the UPS into Sleeping status. Only one computer is responsible for putting the UPS into Sleeping status when all the other computers are shut down.

Table 42 – Workstation configuration

LICO1 configuration	**Value**
Yes, I want to shut down the system	Option checked
Shut down the system only when the event lasts this long (seconds)	2700
Turn off the UPS after the shutdown finishes	Option checked
LICO2 configuration	**Value**
Yes, I want to shut down the system	Option checked
Shut down the system only when the event lasts this long (seconds)	2700
Corail2 configuration	**Value**
Yes, I want to shut down the system	Option checked
Shut down the system only when the event lasts this long (seconds)	2700

If a power failure lasts more than 45 minutes, the LICO2 and Corail2 computers will shut down and the LICO1 computer is in charge of putting the UPS into Sleeping status. When the power is restored, the UPS will start operating to restart the computers. All the computers will start operating at the same time.

7.7 Reinforcement of Light Pods on Side 1

On side 1, the light post moved when there was wind, which caused poor lighting of the containers.

To reduce the effect of the wind on the post on side 1, two bracing bars were installed between the light post on side 1 and the empty post located next to it. The empty post was cut to the same height as the light post to reduce swaying. The bracing bars provide greater stability for the light post in bad weather. The reinforcement work was done on August 12th 2002.

Side 2 was not reinforced because there was no post next to it to brace it. Figure 61 shows the two bracing bars in place.

Figure 61 – Bracing bars

7.8 Images on Hard Disk

A 120 GB hard drive was returned to POM at the request of Richard Desaulniers. The hard drive contained images from the start of the project up to September 2002. The drive was returned on November 15th 2002.

A 100 GB hard drive was returned to POM at the request of Richard Desaulniers. The hard drive contained images from November 3rd 2002 to January 24th 2003. The drive was returned on January 29th 2002.

A 100 GB hard drive was returned to POM at the request of Richard Desaulniers. The hard drive contained images from January 24th 2003 to March 31st 2003. The drive was returned on April 16th 2003.

7.9 Computer Hardware Fix

DTI has replaced several computer parts since the start of the project:

Two APC Basic Surge protectors, 6-outlet

Two 1.44 floppy drives

One LG 52 X CD-ROM

Two Startech removable drive drawers

Two power supply for the LICO2

APC basic surge protector, 6-outlet
Two power bars were installed on the right wall and the back wall of the bungalow to replace the existing ones, which were defective. The one on the back wall provides power for the two Compaq monitors, the right UPS and the power supply card for the right rack that supplies the control box and the LICO and LININT boards. The one on the right wall provides power for the two RF antennas. Figure 62 shows the power bar.

Figure 62 – APC Basic Surge protector, 6-outlet 120V #P6

1.44 floppy drive
Two diskette drives were installed on the Corails because the original units were not compatible with the new cases. The new cases required non-standard diskette drives because the cases already had a front cover for these drives.

LG 52X CD-ROM
A CD-ROM drive was installed on the computer that simulates the AEI at DTI's offices.

Startech removable drive drawers
Two hard drive drawers were installed on the two Corails to install the INO software.

Power supply for LICO2
The power supply for LICO2 was replaced because it was defective.

7.10 RF Antenna Repair

The antenna on side 2 had a problem because its signal was not being received by the LININT board on LICO2. After checking it, CCTC removed the antenna on December 2nd 2002. The internal antenna card was replaced because of a defect.

This antenna was reinstalled at POM on December 5th 2002. Figure 63 shows the antenna in question.

Figure 63 – RF antenna

7.11 Target Light Bulb on Side 1

CCTC replaced the target light bulb on side 1 on November 15th 2002 because of a defect. The dimmer on side 1 was then adjusted immediately after the target light bulb was changed, because installing a new light bulb changed the intensity. Figure 64 shows a target light.

Figure 64 – Target light

7.12 OCRail Modification

Because of the problems encountered with the frame grabbers and timestamps, it was decided to add an option to INO's OCRail software to be able to choose the sequence number or timestamps for pairing the images.

This option is presented as a pull-down menu to choose between the Sequence Number or Timestamp (see Figure 65). The Sequence Number option takes the sequence number into account when analysing the images. The Timestamp option takes the timestamps into account, which are more precise that the sequence number when analysing the images. This modification was done on January 16th 2003.

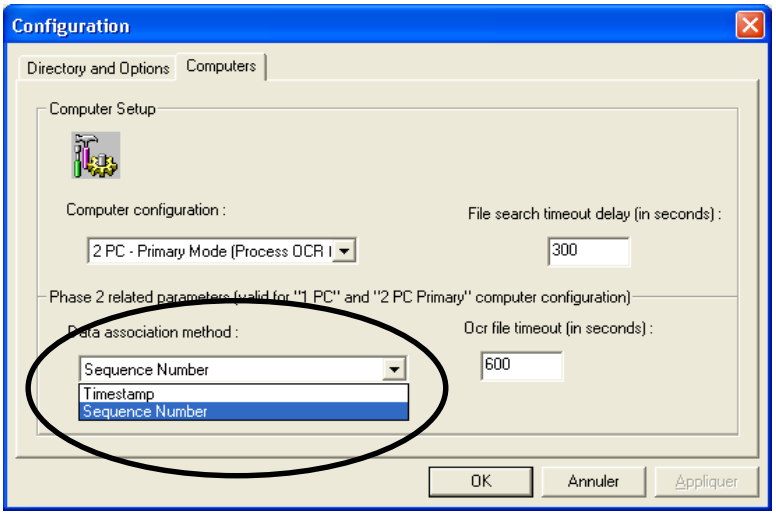


Figure 65 – Pull-down menu

7.13 POM Computer

DTI upgraded a computer to simulate the link at POM. The upgrade was done because the existing computer was not compatible with the Microsoft Windows 2000 operating system. The parts came from Corail2 and the AEI.

The following hardware and software were purchased to complete the upgrade:

- 3COM network interface card
- Startech removable drive
- Microsoft Windows 2000 Pro
- Diskeeper Workstation 7

7.14 Frame Grabber Replacement

The frame grabbers continued to cause problems involving missing sequences in the images for the two sides, but not necessarily at the same time. Several solutions were considered to solve this problem.

Upgrading the LICOs to the Microsoft Windows 2000 operating system was supposed to solve the frame grabber failure problem, but this did not work. The new data translation driver for Windows 2000 had the same problem as Windows NT 4 driver.

Another option was to replace the driver for the frame grabbers. A new Data Translation driver was installed on LICO2 on November 18th 2002, but this did not solve the problem either. The latest version of the the driver had the same problem.

The final solution was to replace the frame grabbers with another model. This solution was retained subsequent to the meeting of November 7th 2002 at DTI's offices attended by CCTC, DTI, INO, POM and TDC.

The Matrox Genesis-LC card was tested at CCTC's laboratories and, following conclusive tests, this card was installed in LICO2 at POM on December 6th 2002.

This solution did not work, however, because the LICO's motherboard was not compatible with the Matrox card. A decision was made to replace the motherboard with one that was compatible with the Matrox card. Because the motherboard was changed, the processor, RAM and power supply were also replaced.

The signal received by the LININT boards was not strong enough because the distance between the RF antenna and the LININT boards was too great for the signal to be clearly interpreted. An RF antenna signal amplifier was installed at POM by CCTC on January 16th 2002 to solve this problem.

Figure 66 is an image of the RF antenna signal amplifier.

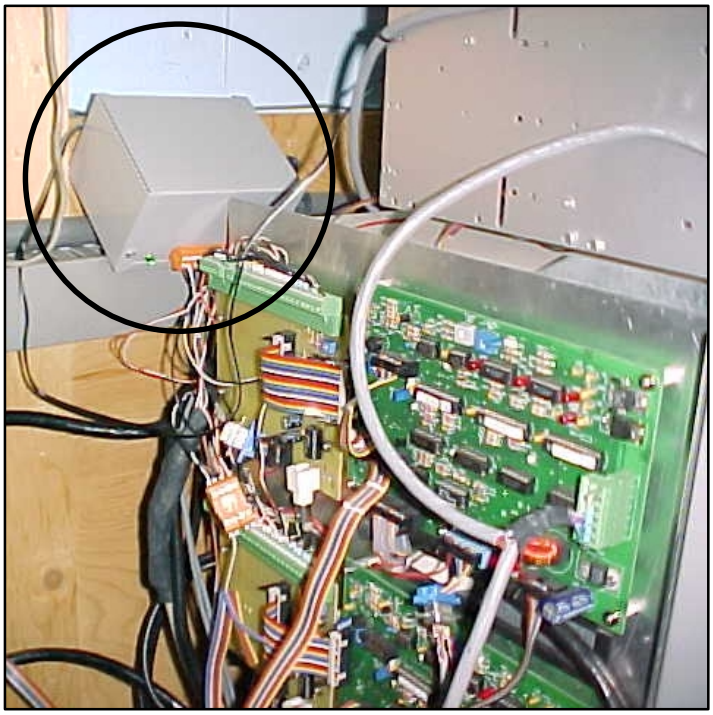

Figure 66 – Amplifier

The following new equipment was purchased:

- Two Matrox Genesis-LC Cards;
- Cables for the Matrox cards;
- One signal amplifier box from CCTC;
- Two TL_MB8000 motherboards;
- Two 1.8 MHz Pentium 4 CPUs;
- Two 256 MB DDR RAM memory sticks (one per computer);
- One power supply for LICO1.

7.15 Boot Leg

The boot leg used to link the A/B sensor had to be replaced because it was damaged. The damage was found by DTI on November 27th 2002.

Figure 67 shows the damaged boot leg.

Figure 67 – Damaged Boot leg

Figure 68 shows the location of the boot leg.

Figure 68 – Location of the boot leg

7.16 Solid State Relay

CCRC replaced solid state relay 3 because of a defect on January 24th 2003.

This solid state relay is for light pod 3. It corresponds to breaker 2 and provides power for lights 1, 3 and 5 below camera 2.

Figure 69 shows the solid state relay that was changed.

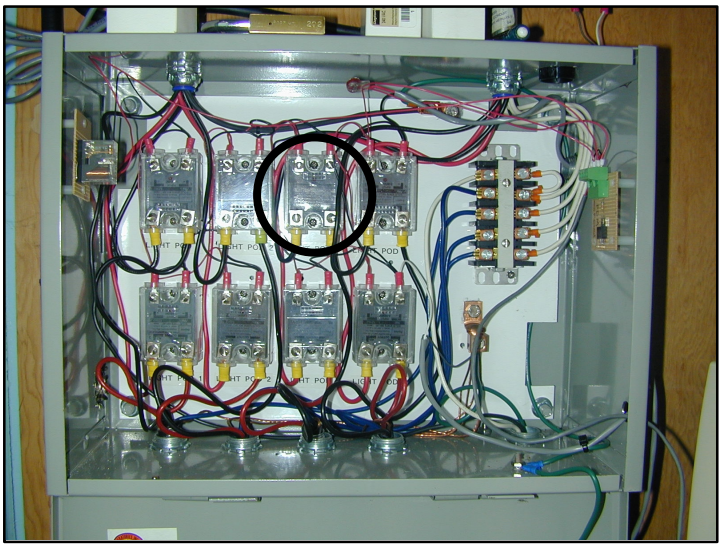

Figure 69 – Solid state relay 3

7.17 Second Hard Drive on Corails

A second hard drive was installed on the two Corails to run the OCRail application. This configuration makes it possible to avoid accessing the C: drives containing the operating system to ensure that they continue to operate properly. The installation, tests and configuration were done successfully on August 5th 2003.

7.18 Category 5 Cable

Two category 5 shielded and tested cables were installed in the bungalow on the UPS on the right and on POM computer to ensure that the entire system had good cabling.

7.19 Replacement of Light Bulb

The light bulb at the bottom of side 1 was replaced because of a defect on February 21st 2003. Figure 70 is a photo of the defective light bulb.

Figure 70 – Defective light bulb

7.20 Replacement of Wheel Sensor

Subsequent to a problem with the double moves with the same time, CCTC checked the wheel sensors and found that east sensor F1 was defective. CCTC replaced it on March 19th 2003. The defective wheel sensor will be refurbished by CCTC to have an extra one on hand in case another wheel sensor is damaged.

Figure 71 shows the defective wheel sensor.

Figure 71 – East wheel sensor F1

7.21 Review of Compliance with ANSI X.12 Standard

The document for the EDI file produced by CCTC was reviewed to determine whether it complied with the ANSI X.12 standard. The review revealed a number of non-compliant situations. Many sections cannot be modified to be compliant with the standard unless they are removed.

It is recommended to leave the contents of the file as is.

7.22 Recovery of Computers

DTI produced a document to make it easier to recover the computers if there are problems with one or more of them. This document contains all the information required to install and configure all the computers and the UPSs.

8 ANALYSIS

8.1 Processing Time

DTI chose to base its processing time analysis approach on the criteria presented in Section 2. Given that no move was similar to the specifications of a reference train move, DTI retained an assumption, accepted by all stakeholders, which met the specified processing time requirements.

To achieve the objective set by POM and Transport Canada, the system would have to process the passage of a train in a time less than or equal to the time set for processing a reference train, or 20 minutes after detection. However, it is absolutely essential that this 6000 ft. train, which travels at a speed of 10 mph (within the established standard of 15 mph 5), take 6 minutes 49 seconds to cross the site completely (maximum duration of a reference train move).

The breakdown by average length of the trains observed shows that the average processing time is less than the established duration (see Table 43).

Table 43 – Breakdown by average length

Length (feet)	# of trains	# of trains with containers	Average # of containers	Average move duration	Average process duration
0 - 500	68			00:01:56	00:31:36
501 - 1 000	10			00:06:32	00:06:56
1 001 - 1 500	15	1	25	00:06:23	00:13:23
1 501 - 2 000	1			00:32:27	00:32:43
2 001 - 2 500	2	2	54	00:03:46	00:04:55
2 501 - 3 000	1	1	80	00:04:54	00:50:39
3 001 - 3 500	4	4	87	00:10:43	00:11:45
3 501 - 4 000	3	3	89	00:05:15	00:06:53
4 001 - 4 500	1	1	107	00:05:51	00:08:11
4 501 - 5 000	4	4	144	00:09:34	00:12:00
5 001 - 5 500	2	2	151	00:12:04	00:14:43
5 501 - 6 000	2	2	164	00:22:45	00:23:58
6 001 +	6	6	226	00:14:18	00:26:24
TOTAL	119	26			

Table 44 presents the processing times noted for the train moves analysed during the period. Note that performance is considered adequate if the two criteria mentioned above (i.e., 20-minute processing time and maximum duration of 6 minutes 49 seconds for a reference move) are maintained. If this is not the case, the objective is not achieved.

Table 44 – Processing times

Date	Move no.	Speed Min	Speed Max	Speed Average	Length	Total of containers	Move time	Move duration	End process time	Process duration	Performance flag	Comments
2003-03-16	809	0	0	0	0		11:19:04	00:01:11	11:22:22	00:03:18	1

									Number of moves :		119	
									Respect of criterias :		96	
									Process time performance :		**80,67%**	

As indicated in Table 44, 23 moves did not conform to the 20-minute limit. However, seven of them had a move duration greater than the fixed maximum. These exceptions are listed in Table 45.

Table 45 – Processing times – exceptions

Move #	Move duration	Processing duration
820	7 min 28 sec	2 hr 22 min 14 sec
842	18 min 36 sec	1 hr 12 min 35 sec
845	18 min 36 sec	2 hr 04 min 25 sec
858	27 min 15 sec	27 min 17 sec
869	35 min 10 sec	35 min 24 sec
888	32 min 27 sec	35 min 24 sec
889	17 min 29 sec	20 min 47 sec

Move 820 was linked to an AEI program problem.

Moves 842 and 845 were linked to an OCR program problem. During the daily inspection, it was noticed that the OCRail program had stopped on computers Corail1 and Corail2. There was no indication of the origin of the closedown in the OCRail's log file, which contains system diagnostics and trace logs. The computers were still on, and no electrical power loss had been reported. DTI asked INO to investigate and determine the cause of the problem, which seemed intermittent. INO and DTI tried to reproduce the shutdown of the OCRail program, but to no avail. INO tried a "burn test" on move 842, but this test did not result in an unexplainable shutdown. The source of the error did not seem to be the software, and the problem itself occurs too randomly to permit the finding of a common factor that would lead to the solution. It could be a conflict between software and hardware, or a problem with the hardware components of the computer. INO modified the OCRail program to increase the number of entries in the log file in order to identify where the problem occurs. The error does not affect the accuracy of the program or the results in any way, but it does cause some delays in the data transfer time to POM. This problem occurred one or two times per week, and a manual intervention was required to restart the program. It would be possible to make a quick fix to correct the problem by adding a "watch dog" connected to the execution of the program.

Moves 858, 869 and 888 had move durations overs 20 minutes.

Move 889 had two EoT problems. CCTC made a software modification to fix this problem.

8.2 Accuracy

The most important acceptance criterion for the AEI/OCR system is the level of accuracy obtained by the OCR program in the identification of container numbers. The OCR system is required to achieve an overall performance of 80% recognition accuracy of standard ISO container identification numbers.

The accuracy of the information transmitted via an EDI train consist file to POM corresponds exactly to the ability of the OCR program to determine the identification code marked on the container. The level of accuracy was achieved despite the following difficulties associated with reading these codes:

- Non-conformance with the ISO 6346 container identification standard
- Shadow effects due to the physical corrugations on the containers
- Nature of the platforms used to transport the containers
- Underexposure or overexposure of the captured images
- Physical condition (e.g., rusted containers)
- Weather conditions
- Different shades and/or colours used on the containers.

In the accuracy calculation, DTI took into account all validity criteria described in Section 2.

Two weeks of acceptance tests confirmed that it would be possible to meet the 80% OCR accuracy target.

Table 46 presents the results obtained on 26 moves observed during the test period.

Table 46 – Moves with containers

8.2.1 Day/Night Accuracy

No difference in results between day and night was observed.

The basis of selection of the moves for Tables 47 and 48 is:

- Daytime: from 6:00 a.m. to 8:00 p.m.
- Nighttime: from 8:00 p.m. to 6:00 a.m.

Table 47 – Daytime accuracy rate

8.2.2 Accuracy – Target Speed Interval Between 10 and 20 mph

Table 49 presents the results obtained when trains travel within the speed determined in POM's acceptance criteria, namely 15 mph 5. Among the trains observed during the period, only 10 of 24 conformed to this speed criterion. Despite this, the accuracy obtained was similar to the rate obtained overall (69.1% vs. 70.7%).

Table 49 – Accuracy rate – speed move variation maximum of 4 mph

9 RECOMMENDATIONS

9.1 OCR Sub-system Redesign

The objective of the redesign is to upgrade the current AEI/OCR prototype by improving the performance of the OCR sub-system. This calls for a redefinition of the internal interface between the AEI sub-system and the OCR sub-system, as well as an improvement of the video module by replacement with up-to-date computer technology.

Many possible design solutions could be proposed to improve the OCR sub-system and its video module. Some are far reaching in terms of overall system design revision, such as integrating illumination and sensor into a single unit. Others require compromises to be made, such as splitting up the image acquisition on two cameras per side to reduce space to a minimum, at the cost of increasing system complexity and maintenance burden. Within the framework of this report, the choice was made to limit system changes to a minimum, retaining the same basic single camera design.

9.2 Overall System Design

Figure 72 shows the schematic of the proposed AEI/OCR data flow. This new design eliminates the dependencies on redundant modules that were generating unwanted complexity and maintainability issues.

The OCR sub-system consists of two video modules and an OCR processing module. Each video module receives timing signals and speed information from the AEI sub-system and handles image acquisition on a particular side. Light beam signals are also acquired, processed and added to the images from within the video module. Each module produces a stream of regularly sampled images that are forwarded to the OCR processing module.

The OCR processing module is responsible for the analysis of the images and the production and transmission of the list of container IDs.

9.2.1 The Video Module

The video module consists of a digital line-scan camera with the proper lens, a target reference light and a computer equipped with a digital frame grabber and a data acquisition card to capture signals from the light beams.

One of the main tasks of the video module is to acquire constant images independent of instantaneous illumination changes. This is achieved through an AGC scheme that includes the use of a target reference within the field of view of the camera. Setting up an AGC requires real-time control over the camera lens component. Currently, the AEI/OCR prototype makes use of iris control on the objective to achieve this result. In the revised design we instead opt for direct control of the exposure time of the camera if this feature is supported on the camera. Direct control implies that the lighting system is able to provide enough light to have sharp images.

The other crucial task is to sample images regularly. The preferred strategy using a line-scan imager is to operate the camera at its fastest rate, assessing train speed from signals coming from the AEI sub-system and applying a slightly deferred decimation scheme.

The video module also has to acquire signals from the light beams and format them into a binary stream encoded within the images themselves. Retaining this encoding strategy is less effective than transferring the light beam signal analysis to the OCR processing module; however, this turns images into self-contained pieces of information, thus providing robustness and simplifying offline processing, two important advantages.

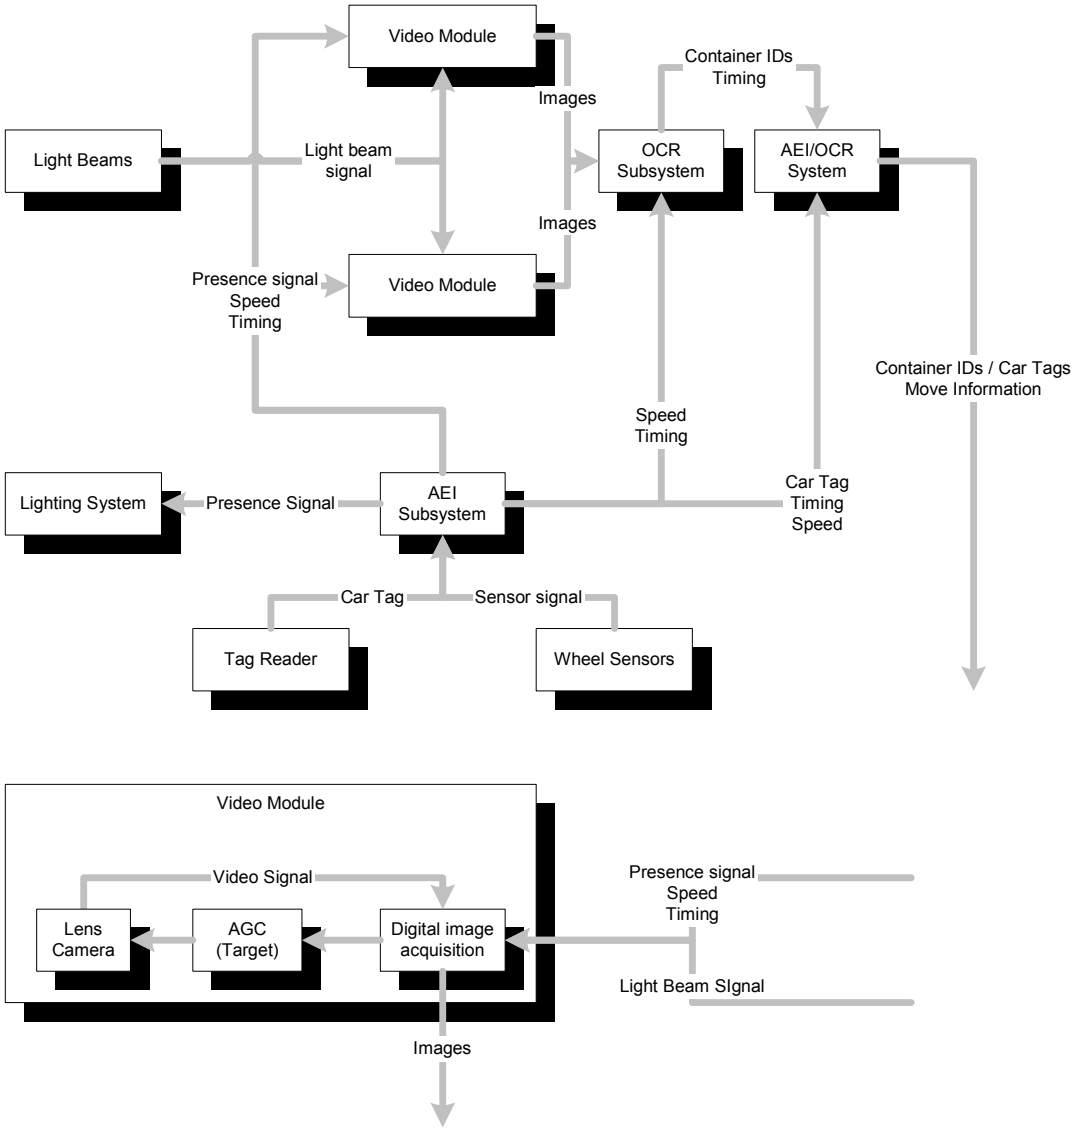

Figure 72 – Proposed data flow for AEI/OCR system

9.2.2 OCR Processing Module

The OCR processing module is a piece of software (OCRail) that would typically be split on two separate computers. These could be the very same computers that are part of the video modules if an appropriate and stable configuration can be achieved.

The OCR analysis itself is divided into four main steps. Image segmentation is the first and most time consuming one. The purpose of this step is to reduce images into a limited number of small formatted regions of interest. Since segmentation has to deal with images as they are produced by the video module, it will have to be adapted to increased resolution and better contrast.

The next two steps are optical character recognition and 1-side intelligent character recognition. These would not be affected by the proposed design changes.

The last step, 2-side intelligent character recognition, would not be affected for single-track systems where information on two sides is always considered available. For double track systems, this step would have to be adapted to conditions where information is available for either one or two sides, depending on circumstances.

9.3 Video Module Components

A key component of the video module is the cameras. To increase the system's effectiveness and exceed the 80% requirement per camera on a continual basis, it would be better to replace the existing cameras and lenses with digital colour cameras.

If the cameras are changed, however the LININT boards would need to be changed as well, and the LICO software would need to be modified to be compatible with the new equipment. In addition, the OCRail software would need to be adapted to analyse colour images.

9.3.1 Camera Model

The current camera used in the prototype is a Perkin-Elmer Reticon LC-3000. The actual model used is an analog line-scan camera featuring 1024 14-micron pixels. The maximum line rate produced by this camera is around 9 kHz. To illustrate possible state-of-the-art replacements for the LC-3000, Dalsa cameras were chosen.

Dalsa Inc. is a world-leading producer of high-end digital line-scan CCD cameras. This Canadian-based company offers a wide product line that includes various line-scan and raster CCD cameras, as well as CMOS-based products.

Table 50 shows the main characteristics of two Dalsa cameras. The Piranha2 is a fast grey-scale line-scan camera, while the Trillium is a colour line-scan camera. Each of these is digital and based on modern sensing technology (i.e., these cameras are roughly 5 times more sensitive than the current cameras in the prototype).

According to our speed constraint computations, either one of these cameras would be fast enough to accommodate a train speed of 100 km/h. It is clear, however, that the Piranha2 camera features far superior performance, yet produces grey-scale images.

Table 50 – Main characteristics of Dalsa CCD line-scan cameras

Product	Colour	Pixels		Line rate (kHz)	Interface	Cost ($CDN)
		#	Size (m)			
Piranha2	grey	4096	7	36	Camera Link	11 000
Trillium	colour	2048	14	11	RS-644 LVDS	11 500

9.3.2 Camera Lenses

A number of Nikkor brand (Nikon) lenses were considered fur use with a Piranha2 camera. For each of these lenses, the minimal stand-off (distance between the camera and the container surface) was computed to allow for a 20 ft. field of view. As can be seen in table 51, the lens gets more expensive as the distance is lessened.

The other important parameter is the f/# number, which is a measure of the lenses' light collecting power. The last three rows of Table 51 feature 28 mm lenses of increasing light collecting power. Here again, the cost of the lens is directly related to its collecting power. This illustrates the potential impact of camera sensitivity on overall system cost.

Hence, if reducing overall system footprint is the main concern, it would be possible to set up the video modules as close as 10 ft. from the container surface using commercial lenses. Any closer distance would likely require an optical design phase that would most certainly lead to an expensive lens.

Finally, note that none of these lenses have iris control, which means that they would have to be used in conjunction with a camera featuring real-time exposure control in the system.

Table 51 – Examples of Nikkor (Nikon) lenses

Product	Stand-off (feet)	Typical cost ($CDN)
AF Nikkor 14mm f/2.8D ED	9.8	2185
AF Nikkor 18mm f/2.8D	12.6	1775
AF Nikkor 20mm f/2.8D	14.0	805
AF Nikkor 24mm f/2.8D	16.8	540
AF Nikkor 28mm f/2.8D	19.6	345
Nikkor 28mm f/2	19.6	1150
AF Nikkor 28mm f/1.4D	19.6	2645

9.3.3 Frame Grabber

Since the Piranha2 camera is a fast 4-tap digital Camera Link camera, a convenient frame grabber is required to both control the camera and retrieve images. A well-known supplier of high-end frame grabbers is Matrox.

Matrox suggests the Meteor-II/Camera Link frame grabber to drive the Piranha2 camera. Using this frame grabber, one can operate the camera at maximum line acquisition rate at least until the internal buffer is filled. For a continuous operation such as envisioned for the AEI/OCR prototype, actual sustained line rate will depend on the frame grabber and computer.

9.3.4 Camera /Lighting Support Structure

The external equipment requires some adjustments to make the make the system more efficient and better adapted to the conditions observed. According to our observations, it would be better to change the cameras and posts, and to modify the target lights.

Camera Posts
The existing wood structure to which the camera housings are attached is a little unstable in high winds and driving rain or when passing trains generate vibrations. Ideally, the posts should be replaced with a metal or other type of structure that is more resistant to vibration and wind. The blowing wind catches the camera housing, which has an effect on the post.

Camera Housing
The camera housings should be remounted, taking the new structure of the posts into account.

Light Posts
The light posts that support the light pods are also a little unstable in bad weather. The current wood structure should be redesigned using a metal structure with several anchor points that do not interfere with the camera's image sensing.

Light Pods(Illumination Lights)
The new light pods installed on site have not caused any problems. However, the fasteners may need to be redesigned if they are not suitable for the new structure to be installed.

Camera Target Light
The target lights were often realigned in this phase of the project. Side 1 was realigned twice and side 2 was realigned four times in seven months. These adjustments were necessary because of the precision of the alignment required with the cameras. Winds and rain vibrations causes the target to move slightly to the left or right, or causes the cameras to move could result in incorrect images. A modification of the target lights should be considered to enlarge the lighted area that is required for good quality images. This way, the target lights can move slightly when there are vibrations and bad weather without causing a noticeable deterioration in the images. Figure 73 shows an example of a camera target light.

Figure 73 – Camera target light

In this phase of the project, a target light bulb was changed because it broke. We thus recommend that long-lasting bulbs that can handle the vibrations and bad weather be installed, thereby resulting in a minimum amount of intervention at the site. These types of bulbs are available from General Electric. The 130 V GE survivor XL 100 W bulbs last about 8,500 hours. They can be used on a 120 V circuit.

Light Beams
Weather conditions such as rain, snow and cold do not interfere with light beam operation. However, the new light beams installed at the site did cause a minor problem. They had to be realigned because the signal was not being received correctly. This problem was caused by the light beam fasteners, which should be redesigned for the new metal structures installed for the light pods.

9.4 Wheel Sensors

The wheel sensors should be replaced or upgraded with CCTC's new models, whose electric contacts have a more weathertight seal. In addition, signalling flags should be installed to indicate the location of the sensors when maintenance work is done on the railway. The sensor cables should be attached differently so as not to be visible from the outside. Figure 74 shows a sensor with visible cables.

Figure 74 – Wheel sensor

9.5 Boot Leg

The boot leg was damaged by a blow from the mobile construction unit. The fragility of this boot leg means that it needs to be covered in a way that protects it better. The cover should be made of metal since this material can easily handle the weight of a vehicle.

Figure 75 is a photo showing the broken boot leg.

Figure 75 – Broken boot leg

9.6 Bungalow

The current bungalow is too small for the amount of equipment it contains. When equipment is connected or disconnected, it is very difficult to reach the connections and there is a risk of accidentally catching on other cables and causing problems. In bad weather, it is difficult for a person to enter to make adjustments and close the door to protect things from breaking.

A alternative solution to increasing the size of the bungalow would be to redesign the interior in a way to maximize the free space available inside, or to reduce the number of computers.

9.7 Cleaning External Equipment

The external equipment should be cleaned because of the dust and bad weather at the site. This cleaning should include the inside of the camera housings and the lenses.

9.8 Internal Infrastructure

9.8.1 Solid State Relay

The configuration of the solid state relays caused a few minor problems. The relays connected to the light pods appeared to cause problems because one of them had to be replaced due to a defect. It would thus be necessary to replace the light pod relays with 45A rather than the 40A that are currently in the solid state relay box.

Figure 76 show the relays to be replaced with 45A. Note that number 3 has already been replaced because of a defect.

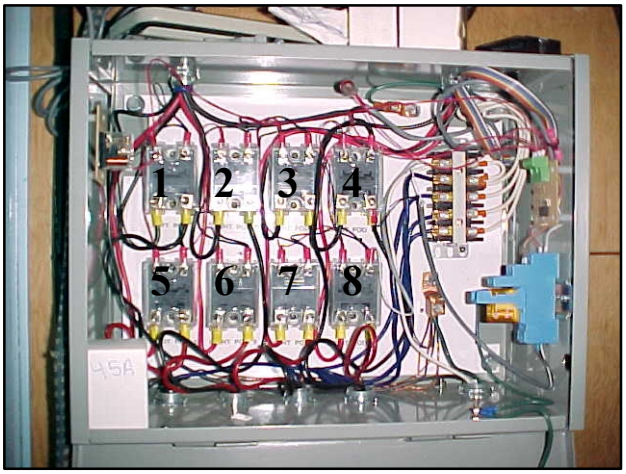

Figure 76 – Relays to change

9.8.2 Heating and Air Conditioning

The heating and air conditioning systems should be reorganized because there is a problem when both systems run at the same time. For instance, when the heat is on and the temperature gets too warm, the air conditioning goes on. The systems then enter a phase in which both of them are operating at the same time.

The solution would be to combine the two systems to avoid this kind of problem. A single control should be used to regulate the temperature inside the bungalow.

9.8.3 ATIB Card

The ATIB card supplied by CCTC and installed in the LICOs should be replaced to be compatible with a PCI slot since the ISA slots are becoming less common and it is very difficult to find motherboards with this kind of slot.

9.8.4 LININT Boards

Because the LININT boards have many connections, it would be better to install them in a case to avoid accidentally catching the wires or connections and causing problems with the image quality.

9.8.5 TC-64 Board

The TC-64 board should be put in a case to avoid damage when work is done in the bungalow. It should also be modified to improve the reaction speed for changes in train speed. The board should be tested to check that it works properly before being put into operation.

9.9 Computer Environment

If the black and white analog cameras are replaced with a digital camera, as recommended, the image transfer time will be much greater. The solution for this problem is to combine the LICO1/Corail1 and LICO2/Corail2 computers. Not transferring images over the network greatly reduces the processing time, thereby reducing network congestion. Only the ICR files should be transmitted over the network to the AEI computer. This network topology would reduce the number of computers in the bungalow and could also solve the space problem.

Combining the LICOs and the Corails on one computer should not slow down the process. Dual processor computers should be installed so as not to increase the processing time. Consequently, the two LICOs and the two Corails should be replaced to have only two computers instead of four. Figures 77 and 78 present the diagram for the new configuration.

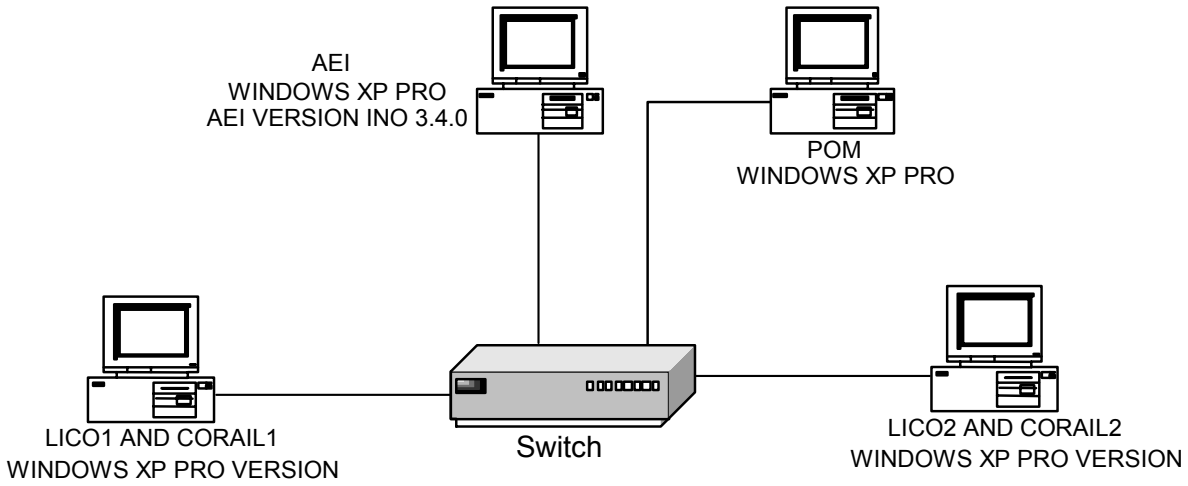

Figure 77 – New network topology

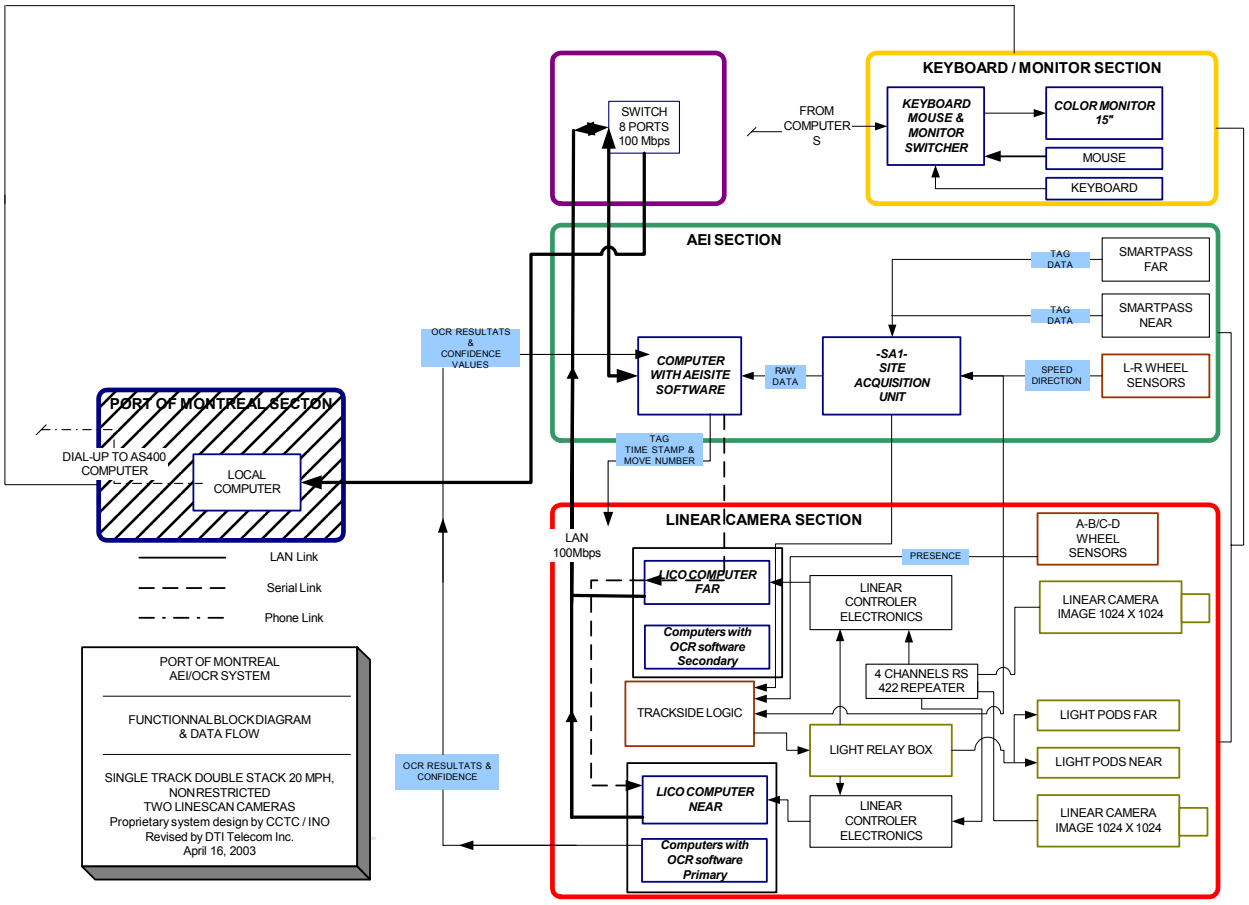

Figure 78 – System diagram

The ASUS A7M266-D motherboard is available for this kind of configuration. This board can support up to two Athlon processors and 3.5 GB of DDR SDRAM.

9.10 Software

These changes would also entail an improvement of the current AEI/OCR prototype by an upgrade of the LICO, AEI and Corail systems as well as improvements to the current OCR algorithm to OCR version 1.2 which has greater functionality. Combining the LICO and OCRAIL programs on the same platform and running the same operating system e.g. MS Windows XP would take advantage of the new computer technology with corresponding faster processors, more memory, etc.

9.10.1 LICO

Upgrade to Windows XP
Microsoft Windows XP is the current version available. At the end of 2004 or beginning of 2005, Microsoft will put the newest version of the operating system (Windows 2005) on the market.

Microsoft will only support the two latest versions of the operating system. Consequently, MS Windows 2000 Pro will be not supported after the launch of Windows 2005. DTI does not recommend putting a system in production that has an operating system without supplier support.

The AEI software is ready to run on MS Windows XP. Only minor changes need to be made to the LICO software to have it ready to run on XP as well.

Forty-five Minute Delay for False Detections
The AEI program delays transmitting the EDI file to POM for 45 minutes when it does not receive the ICR file from the OCRail software, which has not received any images from the LICOs because of false detection. This problem involves a parameter set to 45 minutes inside the AEI program; CCTC can decrease this parameter to 15 or 10 minutes.

This problem has not yet been solved. A code program modification is needed inside the AEI. This can easily be done in the next phase, in which the false detection process will be thoroughly analysed (LICO and AEI).

Frame Grabbing After Two Wheels
In a move, the frame grabbers should start grabbing after two wheels have passed, instead of these, as is currently the case. The modification itself is quite simple, but it will take time to test every situation to ensure that it will not generate extra problems or have any kind of negative impact on the light pods and light beams.

Lost Detection
A move that has two EoT signals can result in the loss of detection by the LICOs (although the AEI still has it), which can hinder analysis of the image. CCTC did not have any explanation for this event. This situation may be related to the wheel sensor problem. CCTC needs to improve the communication between the LICO and AEI programs.

9.10.2 AEI

Axle Field Is 1
The summary provided by the AEI software is not the same as the detail section. In the summary, the value in the Axle field is '1', but in the Detail field it is '0'. This not really a problem as it is a false indication. CCTC needs to make a correction inside the AEI code program to correct this, after which tests will be conducted.

Windows XP
The AEI computer is fast enough to handle the Microsoft Windows XP operating system, and the AEI software was designed to be compatible with this operating system. Consequently, the AEI computer does not need to be upgraded with respect to hardware or software compatibility. DTI needs to test all the functionalities of the AEI software on Windows XP.

Train Stop
When a train stops, the speed cannot be zero because to have this value, a wheel must stop on a sensor. This problem was evaluated to try to find a solution.

It appeared that the train stop did not have any impact on the result except for the generation of a false indication. The train never stopped on the rail or near the area of the sensors. It was only proven once that the program had sent the wrong information to the camera, which continued to grab the same lines consequently, the LICO continued to build the received/incoming images using the same lines for many minutes.

According to CCTC, this situation is very difficult to resolve, and a solution may be very expensive to implement efficiently. Occurrence of this problem was very rare (it happened once).

To solve this problem, new hardware parts that detect the speed of the incoming train could be added. This solution is not based on the detection of the wheels, but it has a major impact on the software and the equipment parts related to that functionality.

9.10.3 Corail

Upgrade
The OCRail software should be upgraded because some code identification problems were observed. Many codes were entered incorrectly for no reason.

INO is still working on the new generation of the OCR kernel (i.e., version 1.2). In this phase, the decision was made to keep version 1.1 of the OCR program. Version 1.2 is ready, has more functionalities – it is more rugged and code improvements have been made – and might be more powerful and more accurate.

Version 1.1 has caused no problem to date. We recommend continuing to build on the old version without using the kernel parts of the newest version.

Windows XP
Corail is now running on Microsoft Windows 2000 Pro but it is ready to run on Microsoft Windows XP. DTI has performed some preliminary tests with XP.

Another solution could be to put LICO and OCRail software on the same computer. Both applications would then be working under the same operating system.

OCRail Application
A failure of the OCR application caused image analysis problems. It was noted that the OCRail program had stopped on computers Corail1 and Corail2. There was no indication of the origin of the shutdown in the OCRail's log file, which contains system diagnostics and trace logs. The computers were still on, and no electrical power loss had been reported.

DTI asked INO to investigate and determine the cause of the OCR program shutdown problem, which seemed intermittent. INO and DTI tried to reproduce the shutdown of the OCRail program, but to no avail. INO tried a “burn test” on some moves, but the laboratoery tests were not able to explain the shutdown.

The source of the error did not seem to be the software, and the problem itself occurs too randomly to permit the finding of the cause. It could be a conflict between software and hardware, or a problem with the hardware components of the computer. INO modified the OCRail program to increase the number of entries in the log file in order to identify where the problem occurs.

The error occurred once or twice each week, and a manual intervention was required to restart the program. The error does not affect the accuracy of the program or the results in any way, but it does cause some delays in the data transfer time to POM.

An interim solution was found in installing a “watchdog” over the execution of the program.

In the future more extensive field tests should be done to determine the problem in order to ensure that this application works properly.

9.11 Cleaning of Interior Equipment

The interior of the bungalow and the equipment in it should be cleaned because of the dust and sand at the site.

10 CONCLUSIONS / DISCUSSION

This R&D project was undertaken to help the Port of Montreal improve the efficiency and productivity of container movement through the Port. A thorough analysis of the AEI/OCR system hardware and software configurations was carried out to arrive at the optimal image transfer. Hardware and software modifications were introduced that resulted in improvements to system efficiency, accuracy, and stability. The AEI/OCR system tested at the Port has achieved an overall accuracy of 92 percent and exceeded the specified accuracy and processing time criteria.

The acceptance tests were successful and yielded a container code recognition accuracy of 91.76 percent for 12 train moves the first week and 90.80 percent for 14 train moves the second week. The overall result for the period was 91.31 percent accuracy for the 3,359 valid containers and 87 percent overall accuracy for all 3,494 containers. The results obtained during the acceptance tests clearly showed that the acceptance criteria were met and exceeded, without taking the train length or speed criteria into account. Containers trains were observed at speeds ranging from 0 to 15 mph and with lengths varying between 1,309 and 9,821 ft. The code recognition accuracy did not depend on the length or speed of the train, but rather on the sharpness, clarity and definition of the images.

The network's data transfer performance and the OCR processing of the container ID numbers was achieved in near real time. The processing and electronic transfer time to send the results to a server required less than three minutes afeter the end of a train, welll under the 20-minute maximum processing time for all information gathered from a 6,000-ft. train, each car of which is loaded with two 40-ft. and two 20-ft. containers.

The test demonstrated that the system was able to achieve the performance and reliability required in an operational environment. A key finding was the importane of proper system and hardware integration. OCR processing time and network performance was markedly improved through the use of more powerful computers that allow the results to be sent to the host computer within 3 minutes of the end-of-train (EoT) and reduce the overall network transfer time to 10 to 15 minutes.

Using faster computers and/or combining the LICO and OCR software programs on the same computer can also decrease the processing time and data transfer period. The computer processors available are now twice as fast as the one currently in use. The computer memory and memory bus; the computer disk I/O bus; and the hard drive are also faster. Also, IDE disk technology can be replaced by a SCSI disk with an Ultra SCSI card. The OCR processing time of the container ID numbers will easily take les than 3 minutes after the EoT with the computer technologies now available on the market. New computer technologies can be procured, but if the current one is not setup (hardware) and configured (software) properly, the full potential of hardware is very unlikely to be reached.

The research and development phase for the AEI/OCR system demonstrated that it is possible in all cases to reach, and in most situations to greatly exceed, the acceptance criteria. The system is now ready to be incorporated into a real operating environment. The AEI/OCR system can be incorporated in an overall freight tracking system involving e-manifest and e-seals on containers or installed independently.

Implementing this system in a more restricted environment or in a location having multiple train tracks would require examining the use of a colour camera with higher definition. It is also possible to reduce the distance betweeh the train and the camera by using one camera of the top ontainers and a second camera for the bottom containers.

With this kind of camera, it would be possible to increase the effectiveness of character recognition by adding colour parameters to improve the identification of letters and numbers. The colour of the ISO code is different from the colour of the container (usually, the letters and numbers are black and their square background is white). The colour camera would enhance the colour spectrum differentiation of the ISO code by identifying the colour of the ISO code instead of determining the ISO code using greyscale.

The existing analog camera employs a LININT board, which is considered old technology. According to the type of camera used, the LININT board must be modified to adapt it to the new camera parameters. Another possibility would be to have the camera controlled directly by the software instead of undergoing the LININT board process: hence, incorporating the control directly into the LICO design to interface with the digital camera. An engineering study should be done to recommend the best alternative based on the chosen camera.

This alternative is not inexpensive because some parts of the hardware (e.g., LININT board) are hardware dependant, and the LICO and OCRail codes that were written in accordance with the capabilities of the current cameras will have to be rewritten. However costly, these substitutions will dramatically improve the accuracy rates. Changing both monochrome cameras to a single colour camera – and modifying the software accordingly for the OCR and AEI systems and redesigning the LININT board – would give the same, if not better, results. If a single colour camera is able to achieve the accuracy 80 percent requirement, the AEI/OCR system can be installed on a double track without any problem. The current result with two analog cameras is 90 percent, we can assume that the accuracy with two digital colour cameras could attain 95 percent recognition accuracy.

The variation in speed caused some problems with the image sensing. It was noted that when the variation between the minimum and maximum speed was less than 5 mph, maximum efficiency results were obtained from the OCR software. Work still needs to be done on the AEI system to allow for real-time decision making with respect to image acquisition and the composition of a less stretched or compressed image when a train speeds up or slows down.

Minor issues such as the alarms, the watch dog or the extra-life time lights should be considered for a new installation. These issues would make it possible to provide an operating environment that requires less maintenance and regular monitoring.

With the improvements made over the last year and the conclusive results observed over the last few months, the AEI/OCR system is now ready for an implementation project. Depending on the site chosen, some modifications will be required to adapt to the physical constraints of the new location.

The AEI/OCR system tested at Port of Montreal has met the specified accuracy and processing time criteria. The test demonstrated that the system was able to achieve the performance and reliability required of an operational environment.

APPENDIX A

GE Survivor™ XL Bulbs

ONE TOUGH BULB.
BUILT TO LAST.

GE SURVIVOR™ XL BULBS

The best combination of benefits to meet the demands of commercial and industrial use. The GE name assures you'll get the quality, durability and reliability you expect.

Built tough to last, even under many "rough service" conditions. Survivor XL bulbs have extra filament supports to protect the bulb against early burn-outs caused by bumps, jars and vibration. This tougher design makes them suitable for many rough service applications.

Xtra Life...lasts 3,000 hours, three to four times longer than standard bulbs.* XL means Xtra Life and Survivor XL's stronger, single coil filament increases lamp life, reducing inconvenience and hazard of burned out bulbs.

Applications

- Office
- Hotel/Motel
- Industrial
- Restaurant
- Hallways
- Stairways
- Guest Rooms
- Security Areas
- Storage Areas

For super long life 130-volt Survivor XL... 8,500 hours on 120V circuit†. For even longer life, 130-volt Survivor XL bulbs can be used on 120-volt circuits to provide an average life of 8,500 hours. That's more than two years of service at 10 hours per day, one year of continuous operation†.

Brass base avoids corrosion, assures easy lamp removal.

Economically priced. Survivor XL is an economically priced alternative to provide the best all-around service in commercial and industrial applications.

* All long life incandescent bulbs trade light output for extra life. Survivor XL bulbs provide a 380% to 400% increase in life with 68% to 75% of the light of ordinary bulbs.

† Operated in this manner, the 130-volt Survivor XL consumes only 88% of its rated watts and provides 75% of its rated light output.

1 INTRODUCTION

The aim of the AEI/OCR system delivered to the Port of Montreal is to carry on-the-fly reading of both the AEI tags present on the railcars and the ID code painted on the containers. The system was designed back in 1997-98, since then huge technological developments occurred in the field of imaging sensors and cameras, making it relevant to review the video aspects of the system.
Experience with setting up to work the prototype and operating it also showed that making the main sub-systems of the prototype less interdependent would lead to simplified calibration and maintenance.
This report is a preliminary discussion for the redesign of the OCR sub-system including a brief component study. A rough estimate of the required manpower and consumables to perform the redesign is also provided.

1.1 Current system design

1.1.1 Physical implantation

Figure 1 gives a schematic view of side 1 of the physical implantation of the AEI/OCR system. The prototype features a number of sensors disseminated outside, along the track side. Among them are wheel sensors (axle detectors) in charge of detecting the presence of a train and perform speed assessment.
The post farthest to the track holds the camera and its housing. The camera is of the line scan type, with a field of view covering 20', such that a double-stack of containers falls entirely within the vertical field of view.
The post nearest to the track bears a standard AEI antenna (SmartPass), and different types of lighting. The later include two main lighting stages (top and bottom) which are responsible for the uniform illumination over the surface of the containers and a calibration target used to control the gain of the camera. It also includes two light beam sensors whose purpose is to detect container presence on the top or the bottom stack.
The prototype also features a bungalow that shelters the computers and required electronics.

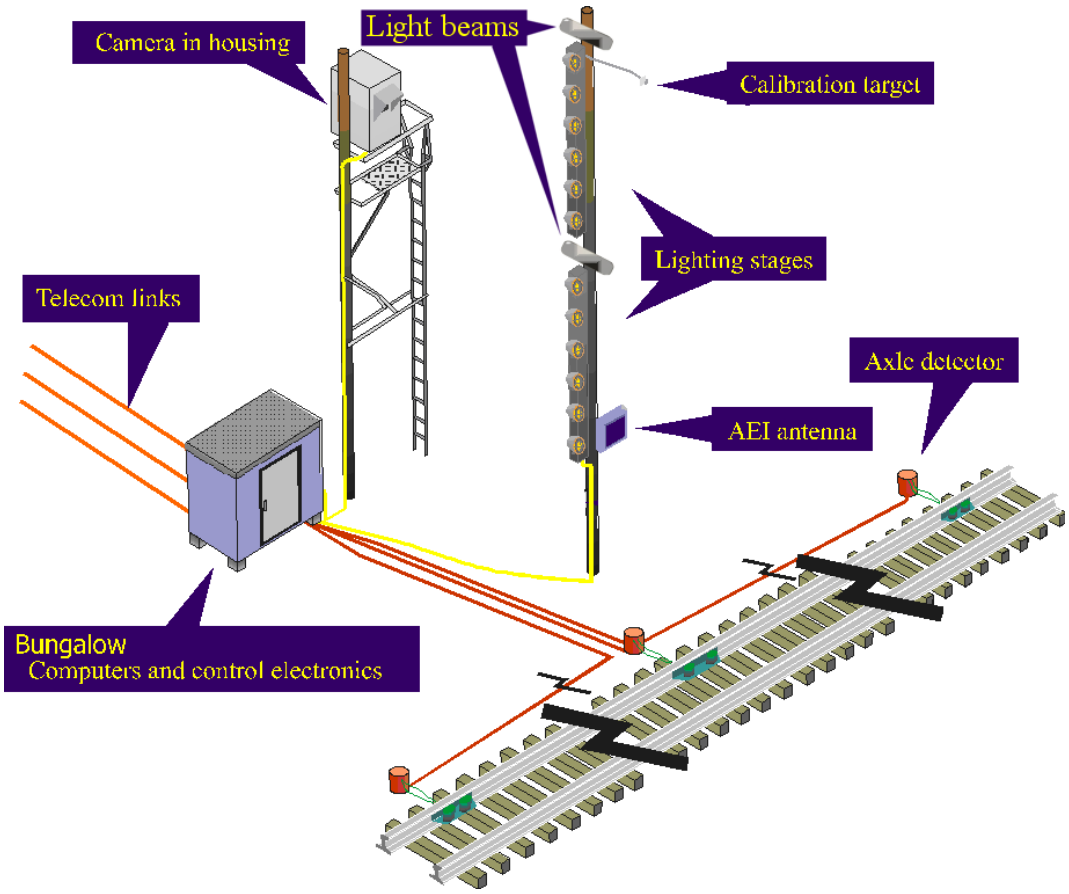

Figure 1: Site schematics for side 1 of the prototype, and its relation to the track.

1.1.2 Logical implantation

Fundamentally, the system consists of three independent sub-systems referred to as the linear camera (LICO), OCR and AEI respectively.
The LICO sub-system handles train detection, image acquisition and file generation (IMG format). Since linear cameras are used, images are formed in line scan fashion. A two dimensional reconstruction of the train is thus achieved by juxtaposition of several line frames. Consequently, the whole length of the train can be considered to be a single image although its physical representation is divided into smaller, more manageable blocks for convenience.
The video module of the LICO sub-system acquires images by sampling the cameras at the maximum rate and sub-sampling the video signal according to the train speed. Speed is obtained from the AEI sub-system. Light beam signals and train related information is encoded into the image header. The image is written on a designated hard disk drive. The automated gain control strategy is achieved by monitoring the intensity of the target reference light within the images. This intensity is compared to a pre-set reference level to control a motorized iris within the objective of the camera.
The images produced are processed by the OCR sub-systems (one for each camera) which produce a preliminary container code that will be retrieved and merged with the one found on the other side of the container. The resulting code and the relevant train information are then written into a file that will be read by the AEI sub-system.

The AEI sub-system is responsible among other things of reading the AEI tags attached to railcars. In addition, it provides timing and speed signals for the linear camera section. Finally, once the OCR processing is complete, the AEI section is also responsible for the integration of the AEI information with the OCR information. The result of this integration is an EDI-based file that gets transmitted to the Port.

1.1.3 System specifications

Train speed

Train speed is assessed from wheel sensors. The train is going at from 0 mph to 20 mph.

Processing time

Output produced in 20 min.

Recognition accuracy

Overall accuracy of at least 80% on container codes.

1.2 Design contraints

This section briefly describes the two main design constraints that were considered in writing this report.

1.2.1 Train speed

In order to be versatile, the system should accommodate for train speeds up to 60 mph (100km/h), assuming that the wheel could reliably measure that speed.
This requirement on speed leads to a requirement on camera line scan rate. In fact, the minimum line rate of the camera is the train speed divided by pixel size. The computation was achieved for 1024, 2048 and 4096-pixel cameras and shown in Table.

Table 1: Required camera line rate as a function of the number of pixels.

Pixels	Pixel size on container (mm)	Required line rate (kHz)
1024	6	4.6
2048	3	9.2
4096	1.5	18.5

1.2.2 Space limitation

The system total encumbrance is of consequence. The actual prototype spans some 20’ each side of the track. Reducing the overall space requirement to about 10’ each side would potentially lead to a simpler system design as both illumination and the cameras could be mounted on a single post.
The stand-off constraint for the camera is thus expressed as any distance up to 20’.

1.3 Scope of the report

Many possible design solutions could be proposed to improve the OCR sub-system and its video module. Some are far reaching in terms of overall system design revision, such as integrating illumination with sensor into a single unit. Other require compromises to be made, such as splitting-up the acquisition on two cameras per side to reduce space to a minimum, at the cost of increasing system complexity and maintenance burden.
Within this report, the choice was made to limit system changes to a minimum, retaining the same basic single camera design.

2 OCR SUB-SYSTEM REDESIGN

2.1 Objective

The objective of the redesign is to upgrade the current AEI/OCR prototype by improving the performance of the OCR sub-system. This aim calls for a redefinition of the internal interface between the AEI sub-system and the OCR sub-system, as well as an improvement of the video module by replacement with up-to-date technology.

2.2 Overall system design

Figure shows the schematic of the proposed AEI/OCR data flow. This new design would eliminate the dependencies on redundant modules that were generating unwanted complexity and maintainability issues.
The OCR sub-system would be made of two video modules and an OCR processing module. Each video module would receive timing signals and speed information from the AEI sub-system and handle image acquisition on a particular side. Light beams signals would also be acquired, processed and added to the images from within the video module. Each module would produce a stream of regularly sampled images that would be forwarded to the OCR processing module.
The OCR processing module would be responsible for the analysis of the images and the production and transmission of the list of container IDs.

2.2.1 The video module

A video module would be made of a digital line scan camera with the proper objective lens, a target reference light and a computer equipped with a digital frame grabber and a data acquisition card to capture signal from the light beams.
One of the main task of the video module is to acquire constant images independent of instantaneous illumination changes. This is achieved through an automated gain control (AGC) scheme that includes the use of a target reference within the field of view of the camera. Setting up an AGC requires real-time control over the camera-objective component. Currently, the AEI/OCR prototype makes use of iris control on the objective to achieve this result. In a revised design we would instead opt for direct control on the exposure time of the camera if this feature is supported on the camera. Direct control implies that the lighting system is able to provide enough light in order to have sharp images.

The other crucial task is to regularly sample images. The preferred strategy using a line scan imager is to operate the camera at its fastest rate, assessing train speed from signal coming from the AEI sub-system and applying a slightly deferred decimation scheme.
The video module finally has to acquire and format signals from the light beams into a binary stream encoded within the images themselves. Retaining this encoding strategy is less effective than transferring the light beam signal analysis to the OCR processing module. However, this turns images into self-contained pieces of information, thus providing robustness and simplifying offline processing, two important advantages.

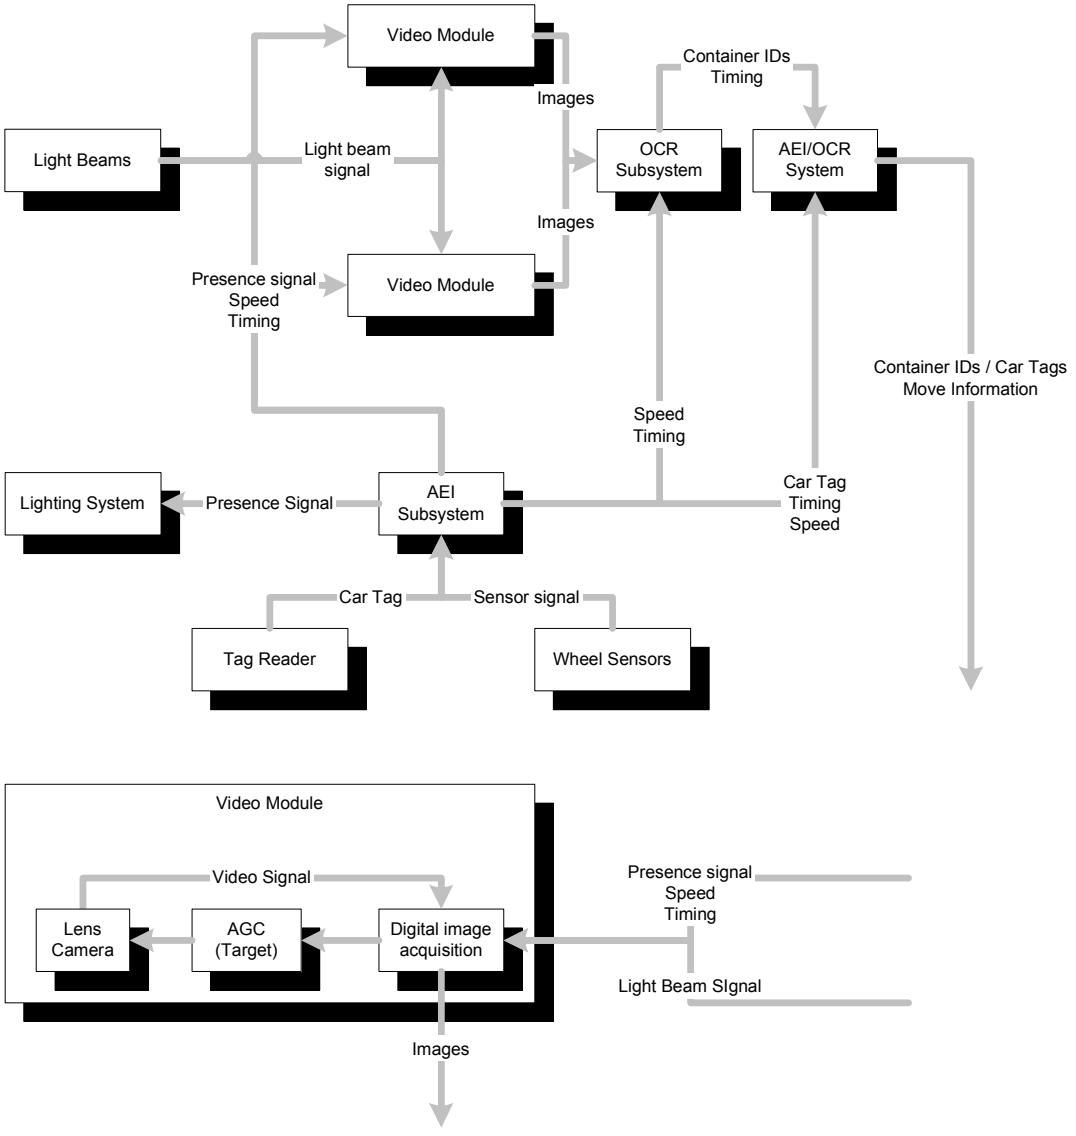

Figure 2 : Proposed data flow for the AEI/OCR system.

2.2.2 The OCR processing module

The OCR processing module is basically a piece of software (OCRail) that would typically be split on two separate computers. These could be the very same computers that are part of the video modules if an appropriate and stable configuration can be achieved.
The OCR analysis itself is divided into four main steps. Image segmentation is the first and most time consuming one. The purpose of this step is to reduce images into a limited number of small formatted regions of interest. Since segmentation has to deal with images as they are produced by the video module, it will have to be adapted to increased resolution and better contrast.
The next two steps are optical character recognition and 1-side intelligent character recognition. These would not be affected by the proposed design changes.
The last step, 2-sides intelligent character recognition would not be affected for single track systems where information on two sides is always considered available. For double track systems, this step would have to be adapted to conditions where information is available for either one or two sides depending on circumstances.

2.3 Video module components

2.3.1 Camera

The current camera used within the prototype is a Perkin-Elmer Reticon LC-3000. The actual model used is an analog line scan camera featuring 1024 14-micron pixels. The maximum line rate produced by this camera is around 9 kHz. To illustrate possible state-of-the-art replacements for the LC-3000, Dalsa cameras were chosen.
Dalsa Inc. is a world leading producer of high-end digital line scan CCD cameras. This Canadian-based company offers a wide product line including various line scan and raster CCD cameras, as well as CMOS based products.
Table shows the main characteristics of two Dalsa cameras. The Piranha2 is a fast grey scale line scan camera, while the Trillium is a colour line scan camera. Each of these are digital and based on modern sensing technology, i.e. one can consider that these cameras are roughly 5 times more sensitive than the current cameras of the prototype.
According to our speed constraints computations, either one of these cameras would be fast enough to accommodate a train speed of 100 km/h. It is clear however that the Piranha2 camera features far superior performance, yet producing greyscale images.

Table 2: Examples of Dalsa CCD line scan cameras main characteristics.

Product	Colour	Pixels		Line rate (kHz)	Interface	Cost ($CDN)
		#	Size (m)			
Piranha2	grey	4096	7	36	Camera Link	11 000
Trillium	colour	2048	14	11	RS-644 LVDS	11 500

2.3.2 Objective

Considering the use of a Piranha2 camera, we took a short look at possible objectives among the Nikkor brand (

Table). For each of these objectives, the minimal stand off (distance between camera and the container surface) was computed to allow for a 20' field of view. As can be seen, the objectives are getting more expensive as the distance is lessened.

The other important parameter is the f/# number, which is a measure of light collecting power of the objective. The last threes entries of

Table feature 28mm objectives of increasing collecting power. Here again, objective cost is directly related to the collecting power of the objective. This illustrates the potential impact of camera sensitivity on overall system cost.
Hence, if reducing overall system encumbrance is the main concern, it would be possible to set-up the video modules as close as 10' from the container surface using commercial objectives. Any closer distance would likely require an optical design phase that would most certainly lead to an expensive (> 3000 $CDN) objective.
Finally, note that none of these objectives have iris control, which means that they would have to be used in conjunction with a camera featuring real-time exposure control in the system.

Table 3: Examples of Nikkor (Nikon) objectives.

Product	Stand off (feet)	Typical cost ($CDN)
AF Nikkor 14mm f/2.8D ED	9.8	2185
AF Nikkor 18mm f/2.8D	12.6	1775
AF Nikkor 20mm f/2.8D	14.0	805
AF Nikkor 24mm f/2.8D	16.8	540
AF Nikkor 28mm f/2.8D	19.6	345
Nikkor 28mm f/2	19.6	1150
AF Nikkor 28mm f/1.4D	19.6	2645

2.3.3 Frame grabber

Since the Piranha2 camera is a fast 4-tap digital Camera Link camera, a convenient frame grabber is required both to control the camera and retrieve images. A natural supplier of high-end frame grabbers is Matrox.
Matrox proposes the Meteor-II/Camera Link frame grabber to drive the Piranha2 camera. Using this frame grabber, one can operate the camera at maximum line acquisition rate at least until internal buffer is filled. For a continuous operation such as envisioned for the AEI/OCR prototype, actual sustained line rate will depend on the frame grabber and computer.
A frame grabber such as the Meteor-II/Camera Link costs around 3,000$CDN.

2.4 OCR sub-system redesign project

This is a rough order of magnitude estimate for a project that would consist in implementing the proposed OCR sub-system redesign.
Note:

> **This is a preliminary price range estimate (Rough Order of Magnitude – ROM), provided solely at the potential client's demand and does not legally bind INO.**

2.4.1 Tasks

In order to perform the proposed OCR sub-system redesign, the following series of tasks would be required:

- System design
- Software programming
- Physical integration
- Unit tests
- Field tests
- Management and reporting

2.4.2 Estimated cost

The total project cost would be around 150 k$

Manpower	105 k$
Consumables	45 k$

2.4.3 Estimated schedule

9-12 months.

2.4.4 Technical Risks

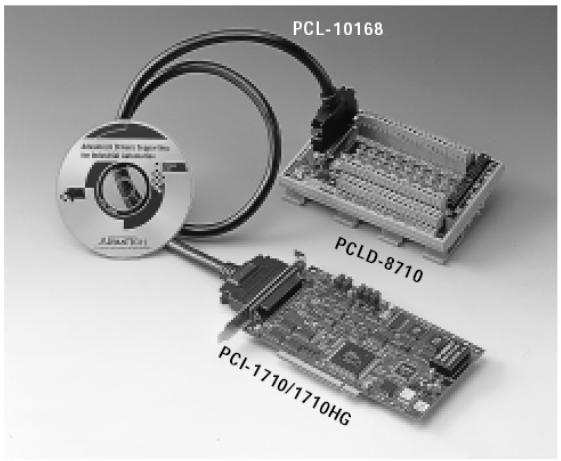
The main technical risk is the availability of an AEI/OCR prototype and accessibility to the system. Then most probably the distance between the cameras and the surface of the containers would be different from the current one, implying changes in the post layout of the system. This aspect is outside of the current estimate.
Another requirement to insure success of the redesign is the involvement of a partner that would adapt the AEI sub-system in parallel with the new OCR sub-system. The natural partner for this type of work is Tyco.

APPENDIX C

PCI-1710 / DaqBoard/2000™ Series / PCI Watchdog Timers for Windows NT

PCI-1710/1710L
PCI-1710HG/HGL

12-bit, 100 kHz, (High-gain), PCI-bus Multi-function DAS Card



Features

- 16 single-ended or 8 differential analog inputs, or a combination
- 12-bit A/D converter, with up to 100 kHz sampling rate
- Programmable gain for each input channel
- Free combination of single-ended and differential inputs
- On-board 4 K samples FIFO buffer
- Two 12-bit analog output channels
- 16 digital inputs and 16 digital outputs
- Programmable pacer/counter

Introduction

The PCI-1710/1710HG is a multifunction DAS card for the PCI bus. Its advanced circuit design provides higher quality and more functions, including the five most desired measurement and control functions: 12-bit A/D conversion, D/A conversion, digital input, digital output, and counter/timer.

PCI-1710 series provide specific functions for different user requirements:

PCI-1710	100 kS/s, 12-bit Multifunction Card
PCI-1710L	100 kS/s, 12-bit Multifunction Card w/o AO
PCI-1710HG	100 kS/s, 12-bit High-Gain Multifunction Card
PCI-1710HGL	100 kS/s, 12-bit High-Gain Multifunction Card w/o AO

Mixed Single-ended or Differential Analog Inputs

The PCI-1710/1710HG features an automatic channel/gain scanning circuit. The circuit, rather than your software, controls multiplexer switching during sampling. The on-board SRAM stores different gain values and configurations for each channel. This design lets you perform multi-channel high-speed sampling (up to 100 kHz) with different gains for each channel and with free combination of single-ended and differential inputs.

On-board FIFO (First In First Out) Memory

The PCI-1710/1710HG has an on-board FIFO buffer which can store up to 4K A/D samples. The PCI-1710/1710HG generates an interrupt when the FIFO is half full. This feature provides continuous high-speed data transfer and more predictable performance on Windows systems.

On-board Programmable Counter

The PCI-1710/1710HG provides a programmable counter for generating a pacer trigger for the A/D conversion. The counter chip is an 82C54 or equivalent, which includes three 16-bit counters on a 10 MHz clock. One counter is used as an event counter for counting events coming from the input channels. The other two are cascaded together to make a 32-bit timer for a pacer trigger.

Special Shielded Cable for Noise Reduction

The PCL-10168 shielded cable is specially designed for the PCI-1710/1710HG for reducing noise in the analog signal lines. Its wires are all twisted pairs, and the analog lines and digital lines are seperately shielded, providing minimal cross talk between signals and the best protection against EMI/EMC problems.

Specifications

Analog Input:

- **Channels:** 16 single-ended or 8 differential (software programmable)
- **Resolution:** 12-bit
- **On-board FIFO:** 4 K samples
- **Conversion time:** 8 µs
- **Input range:**(V, software programmable)

	PCI-1710/1710L	PCI-1710HG/1710HGL
Bipolar	±10, ±5, ±2.5, ±1.25, ± 0.625	±10, ±5, ±1, ±0.5, ±0.1, ±0.05, ±0.01, ±0.005
Unipolar	0 ~ 10, 0 ~ 5, 0 ~ 2.5, 0 ~ 1.25	0 ~ 10, 0 ~ 1, 0 ~ 0.1, 0 ~ 0.001

- **Maximum Input Overvoltage:** ±30 V
- **Common Mode Rejection Ratio (CMRR):**

PCI-1710/1710L		PCI-1710HG/1710HGL	
Gain	CMRR	Gain	CMRR
0.5, 1	75dB	0.5, 1	75dB
2	80dB	10	90dB
4	84dB	100	106dB
8	84dB	1000	106dB

- **Maximum sampling rate:** (S/s, depending on PGIA settling time)

	Gain	Max. Sampling Rate
PCI-1710/1710L	0.5, 1, 2, 4, 8	100 kS/s
PCI-1710HG/1710HGL	0.5, 1	100 kS/s
	5, 10	35 kS/s
	50, 100	7 kS/s
	500, 1000	770 kS/s

Note: The sampling rate depends on the computer hardware architecture and software environment. The rates may vary due to programming language, code efficiency, CPU utilization and so on.

- **Accuracy:** (Depends on gain)

PCI-1710		PCI-1710HG		
Gain	Accuracy	Gain	Accuracy	Remark
0.5, 1	0.01% of FSR ±1 LSB	0.5, 1	0.01% of FSR ±1 LSB	S.E./E
2	0.02% of FSR ±1 LSB	5, 10	0.02% of FSR ±1 LSB	S.E./E
4	0.02% of FSR ±1 LSB	50, 100	0.04% of FSR ±1 LSB	D
8	0.04% of FSR ±1 LSB	500, 1000	0.08% of FSR ±1 LSB	D

** S.E.: Single-ended D: Differential*

- **Linearity error:** ±1 LSB
- **Input impedance:** 1 GΩ
- **Trigger mode:** Software, on-board programmable pacer or external

Analog Output: (PCI-1710/1710HG only)

- **Channels:** 2
- **Resolution:** 12-bit
- **Relative accuracy:** ±1/2 LSB
- **Gain error:** ±1 LSB
- **Throughut:** 38 kS/s (min.)
- **Slew rate:** 10 V / µs
- **Output range (software programmable):**
  Internal reference: 0 ~ +5 V @ -5 V,
  0 ~ +10 V @ -10 V
  External reference: 0 ~ +x V @ -x V (-10 ≤ x ≤ 10)
- **Driving Capability:** 10 mA

Digital Input:

- **Channels:** 16
- **Input voltage:** Low: 0.4 V max.
  High: 2.4 V min.
- **Input load:** Low: -0.2 mA @ 0.4 V
  High: 20 mA @ 2.7 V

Digital Output:

- **Channels:** 16
- **Output voltage:** Low: 0.4 V max. @ 8.0 mA (sink)
  High: 2.4 V min. @ -0.4 mA (source)

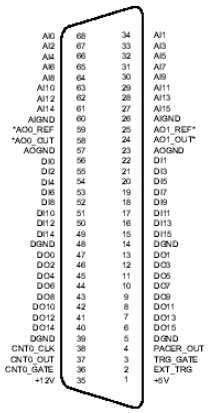
Programmable Timer/Counter

- **Counter chip:** 82C54 or equivalent
- **Counters:** 3 channels, 16 bits, 2 channels are permanently configured as a 32-bit programmable pacer; 1 channel is free for user applications
- **Input, gate:** TTL/CMOS compatible
- **Time base:**
  Channel 1: 10 MHz
  Channel 2: Takes input from output of channel 1
  Channel 0: Internal 1 MHz or external clock
  (10 MHz max.) selected by software.

General:

- **CE certified to CISPR 22 class B**
- **I/O Connector:** 68-pin SCSI-II female connector
- **Power consumption:** +5 V @ 850 mA (Typical),
  +5 V @ 1.0 A (Max.)
- **Operating temperature:** 0° ~ +60° C (32° ~ 140° F) (refer to IEC 68-2-1, 2)
- **Storage temperature:** -20° ~ +70° C (-4° ~ 158° F)
- **Operating humidity:** 5% ~ 95% RH non-condensing (refer to IEC 68-2-3)
- **Dimensions:** 175 mm (L) x 100 mm (H) (6.9" x 3.9")
- **MTBF:** over 64,770 hrs @ 25° C, grounded-fix environment

Pin Assignments



**: Pins 23~25 and pins 57~59 are not defined for PCI-1710L/1710HGL*

Ordering information

- ❑ **PCI-1710**: 12-bit, 100 kS/s Multifunction Card, user's manual and driver CD-ROM. (cable not included)
- ❑ **PCI-1710L**: 12-bit, 100 kS/s Multifunction Card w/o AO, user's manual and driver CD-ROM. (cable not included)
- ❑ **PCI-1710HG**: 12-bit, 100 kS/s High-Gain Multifunction Card, user's manual and driver CD-ROM. (cable not included)
- ❑ **PCI-1710HGL**: 12-bit, 100 kS/s High-Gain Multifunction Card w/o AO, user's manual and driver CD-ROM. (cable not included)
- ❑ **PCLD-8710:** Industrial Wiring Terminal Board with CJC circuit for D/N-rail mounting (cable not included)
- ❑ **PCL-10168:** 68-pin SCSI-II cable with male connectors on both ends and special shielding for noise reduction, 1 and 2 m.
- ❑ **ADAM-3968:** 68-pin SCSI-II Wiring Terminal Board for DIN-Rail Mounting

Note: PCI-1710L and PCI-1710HGL are available soon!

DaqBoard/2000™ Series

16-Bit, 200-kHz PCI & CompactPCI® Data Acquisition Boards

Features

- Six PCI (DaqBoard/2000) and six CompactPCI® (DaqBoard/2000c) versions available
- 16-bit, 200-kHz A/D converter
- 8 differential or 16 single-ended analog inputs (software selectable per channel)
- Expandable up to 256 analog input channels, while maintaining 200 kHz (5 µs per channel) scan rate
- Up to four boards can be installed into one PC for up to 1024 analog input channels
- 100% digital calibration
- 512 location channel/gain FIFO, capable of scanning all channels, including 256 analog expansion channels and digital/counter channels, at 5 µs per channel
- DMA bus mastering for synchronous analog I/O, digital I/O, and counter inputs
- Trigger modes include analog, digital, & software, with <5 µs latency
- Virtually infinite pre-trigger buffer*
- Up to four 16-bit, 100-kHz analog outputs with infinite continuous waveform output capability*
- 40 digital I/O lines, can be scanned synchronously or asynchronously with analog inputs
- Digital I/O is expandable up to 272 lines, including optional isolation and relay closure
- Four counter/pulse input channels can be scanned synchronously or asynchronously with analog inputs
- Two timer/pulse output channels

Signal Conditioning Options

- Signal conditioning & expansion options for thermocouples, strain gages, accelerometers, isolation, RTDs, etc.—over 30 options in all (see p. 143)

Software (see p. 125)

- Included DaqX API library, drivers for Visual Basic®, C++, and Delphi™ for Windows® 95 and higher; C++ for Linux, DASYLab®, TestPoint®, & LabVIEW®
- Optional DaqView2000™ software package
- Optional DaqCOM™ ActiveX/COM-based applications program interface, including network capability

Now with Linux Support!

The DaqBoard/2000 plug-in board provides cost-effective, high-speed data acquisition for up to 470 I/O channels

CompactPCI Versions Now Available!

The new DaqBoard/2000™ series sets the price/performance benchmark for high-speed, multi-function plug-and-play data acquisition for PCI bus computers. The DaqBoard/2000 series hardware design offers all of the features normally found on significantly more expensive boards, including 16-bit, 200-kHz A/D, 100% digital calibration, bus mastering, two or four 16-bit, 100-kHz D/A converters, 40 digital I/O lines, four counters and two timers.

DaqBoard/2000 series is supported by a growing family of over 30 signal conditioning and expansion options, offering signal conditioning for thermocouples, RTDs, accelerometers, isolation, high-voltage, strain gages, and much more. Up to 528 channels of analog and digital I/O can be accessed using one DaqBoard/2000, while maintaining the 5 µs per channel update rate. Up to four DaqBoard/2000s can be installed into one PC.

* Limited only by available PC RAM and hard disk space

Software support is the most extensive of any board, including comprehensive drivers and new ActiveX/COM-based programming tools for nearly every programming environment under Windows® 95 and higher. Included in this list are Visual Basic®, C++, Delphi™, TestPoint®, LabVIEW®, and DASYLab®, and C++ for Linux. Also available is a suite of DaqView™ software options for *Out-of-the-Box*™ setup, acquisition, display, and analysis of acquired data—no programming required. DaqView2000™ combines DaqView, DaqViewXL™, and eZ-PostView™ in one software package for use with the DaqBoard/2000 series.

In total, the DaqBoard/2000 series sets the industry standard for plug-and-play PCI data acquisition. To view or download a comparison chart on a particular board, visit www.iotech.com/DaqBoard2000.

Synchronous I/O for High-Speed Applications

The DaqBoard/2000™ series sets a new standard with its ability to make analog measurements, read digital inputs, and read counter inputs, while synchronously generating up to four analog outputs and/or a 16-bit digital pattern output. Most other boards require CPU interaction to access I/O other than analog input, making it impossible to generate time-critical analog waveforms or digital patterns. With the new DaqBoard/2000 series, the true power of today's PCI-based PCs can be unleashed.

The same synchronous features of the DaqBoard extend to its family of DBK signal conditioning and expansion options. Up to 256 analog input channels and 272 (256, P2 only) digital I/O channels can also be accessed synchronously to one another, with precise and deterministic channel-to-channel timing. Up to four DaqBoards can be installed in one PC, quadrupling the channel capacity to over 1000 analog input channels, 1000 digital I/O channels and 16 high-speed analog output channels.

Signal I/O

One 100-pin connector on the DaqBoard/2000 series provides access to all of the input and output signals. Unlike other multifunction boards that require multiple PC slots in order to access all of the I/O, careful design of the DaqBoard/2000 series accommodates all I/O using one cable, and utilizing a single PCI slot.

The 100-pin DaqBoard/2000 series I/O connector, **P4**, is logically divided into three sub-ports, P1, P2, and P3. **P1**, the analog input port, contains all of the analog input channels, as well as the sequencer control signals for accessing external analog input options. All analog expansion options attach to the P1 port. P2, the general purpose digital I/O port, can be used directly to control and monitor 24 digital I/O lines. P2 can also function as the digital I/O expansion port, whereby the 24 lines are exclusively used to control external digital DBK expansion options, for up to 256 lines of digital input or output. P3 contains an additional 16-bit digital I/O port, as well as the counter inputs, timer outputs, and analog outputs. Several options are available to provide easy user access to all of the I/O signals on P4.

Analog Input (P1)

The DaqBoard/2000 series has a 16-bit, 200-kHz A/D coupled with 16 single-ended, or 8 differential analog inputs. Thirteen software programmable ranges provide inputs from ±10V to ±156 mV full scale. Each channel can be software-configured for a different range, as well as for single-ended or differential, and unipolar or bipolar input. Beyond the 16 built-in analog inputs, the user can expand the DaqBoard/2000 series up to 256 analog inputs using external DBK signal conditioning and expansion options (see p. 143). As with the on-board channels, expansion channels are scanned at the same 5 µs/channel rate (200 kHz), and most are software-programmable for range. There is *no* speed penalty for scanning expansion channels versus built-in channels. The DBK expansion options offer a wide variety of signal measurements, including thermocouples, RTDs, strain gages, accelerometers, high voltage, isolation, current, and much more.

DaqBoard/2000™ Series

General Information

Scanning

The DaqBoard/2000 series has an on-board scan sequencer that permits the user to select any combination of up to 512 channel/range combinations. The sequencer scans all channels contained in the sequence at the fastest rate of 5 µs/channel, thereby minimizing the time-skew from channel-to-channel. The user can also set the time between scan groups, from 0 to 6 hours. In addition to scanning analog inputs, the sequencer can scan digital inputs and counter inputs (see p. 120).

Bus Mastering DMA

The DaqBoard/2000 series supports Bus Mastering DMA, which allows analog and digital/counter input data, as well as analog and digital output data to flow between the PC and the DaqBoard/2000 series without consuming valuable CPU time. The driver supplied with the DaqBoard/2000, as well as all other third-party software support such as TestPoint®, LabVIEW®, and DASYLab®, automatically utilize Bus Mastering DMA to efficiently conduct I/O from the PC to the DaqBoard.

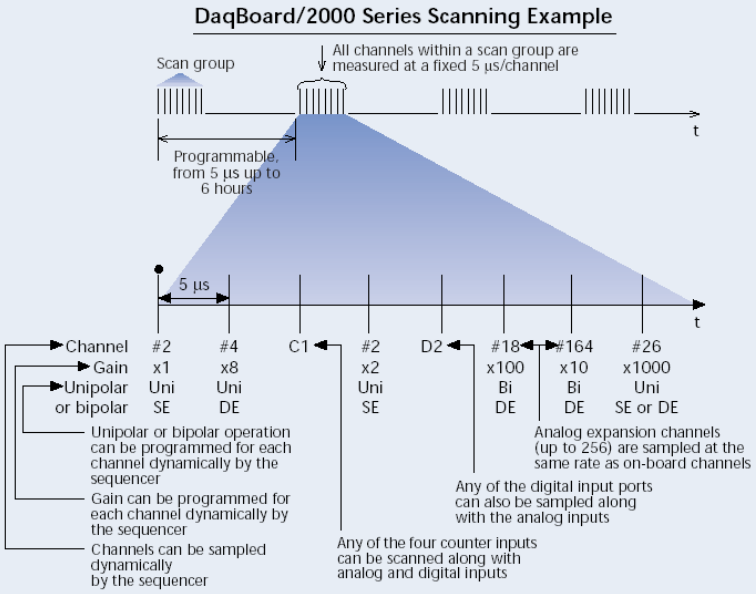
Triggering

Triggering can be the most critical aspect of a data acquisition application. The DaqBoard/2000 series supports a full complement of trigger modes to accommodate any measurement situation.

Hardware Analog Triggering. Many data acquisition boards claim analog triggering, but rely on the PC to take readings and make a decision, which leads to uncertain and potentially long latencies. The DaqBoard/2000 series uses true analog triggering, whereby the trigger level programmed by the user sets an analog DAC, which is then compared in hardware to the analog input level on the selected channel. The result is analog trigger latency which is guaranteed to be less than 5 µs, significantly shorter than most data acquisition boards. Any analog channel can be selected as the trigger channel, including built-in or expansion channels. The user can program both the trigger level, as well as the edge (rising or falling).

Channel-Scanning Flexibility

The DaqBoard/2000 series offers a 512-location scan sequencer that allows you to select each channel and associated input amplifier gain at random. The sequencer circuitry circumvents a major limitation encountered with many plug-in data acquisition boards — a drastic reduction in the scan rate for external expansion channels. All DaqBoard/2000 series channels, including the 528 potential expansion channels, are scanned at 200 kHz (5 µs/channel). In addition, the digital and frequency inputs can be scanned using the same scan sequence employed for analog inputs, enabling the time correlation of acquired digital data to acquired analog data. The DaqBoard/2000 series permits each scan group, which can contain up to 512 channel/gain combinations, to be repeated immediately or at programmable intervals of up to 6 hours. Within each scan group, consecutive channels are measured at a fixed 5 µs/channel rate.



Digital and Pattern Triggering (P1). A separate digital trigger input line is provided, allowing TTL-level triggering, again with latencies guaranteed to be less than 5 µs. Both the logic levels (1 or 0), as well as the edge (rising or falling), can be programmed for the discrete digital trigger input.

Software-Based Triggering. Software-based triggering differs from the modes described above because the readings, analog, digital, or counter, are interrogated by the PC to detect the trigger event, not in the hardware as described above. The advantage of this mode is to permit triggering based on more complex situations, such as on a specific temperature, which was derived from the acquisition of at least two analog measurements, plus the calculation of the measured temperature using linearization algorithms.

The DaqBoard/2000 series also supports digital pattern triggering, whereby the user can designate any of the digital input ports as the trigger port. The programmed digital pattern,

including the ability to mask or ignore specific bits, is then compared to the actual input until a match is detected, after which the sequencer begins the scan sequence.

Triggering can also be programmed to occur when one of the counters reaches, exceeds, or is within a programmed level. Any of the built-in counter/totalizer channels can be programmed as a trigger source.

Normally software-based triggering results in long latencies from the time that a trigger condition is detected, until the actual capturing of data commences. However, the DaqBoard/2000 series circumvents this undesirable phenomenon by use of pre-trigger data. Specifically, when software-based triggering is employed, and the PC detects that a trigger condition has occurred, (which may be thousands of readings later than the actual occurrence of the signal), the DaqBoard driver automatically looks back to the location in memory where the actual trigger-causing measurement occurred. The acquired data that is presented to the user actually begins at the point where the trigger-causing measurement occurs. The latency in this mode is equal to one scan cycle.

Stop Trigger. Any of the software trigger modes described above can also be used to stop an acquisition. Thus an acquisition can be programmed to begin on one event, such as a temperature level, and then can stop on another event, such as a digital pattern.

Pre- and Post-Triggering Modes. Six modes of pre- and post-triggering are supported, providing a wide variety of options to accommodate any measurement requirement. When using pre-trigger, the user must use software-based triggering to initiate an acquisition.

No pre-trigger, post-trigger stop event. This, the simplest of modes, acquires data upon receipt of the trigger, and stops acquiring upon receipt of the stop-trigger event.

Fixed pre-trigger with post-trigger stop event. In this mode, the user specifies the number of pre-trigger readings to be acquired, after which, acquisition continues until a stop-trigger event occurs.

No pre-trigger, infinite post-trigger. No pre-trigger data is acquired in this mode. Instead, data is acquired beginning with the trigger event, and is terminated when the operator issues a command to halt the acquisition.

Fixed pre-trigger with infinite post-trigger. The user specifies the amount of pre-trigger data to acquire, after which the system continues to acquire data until the program issues a command to halt acquisition.

***Variable pre-trigger with post trigger stop event**.* Unlike the previous pre-trigger modes, this mode does not have to satisfy the pre-trigger number of readings before recognizing the trigger event. Thus the number of pre-trigger readings acquired is variable and dependent on the time of the trigger event relative to the start. In this mode, data continues to be acquired until the stop trigger event is detected.

***Variable pre-trigger with infinite post trigger**.* This is similar to the mode described above, except that the acquisition is terminated upon receipt of a command from the program to halt the acquisition.

Calibration

Every range on the DaqBoard/2000 series is calibrated from the factory using a digital calibration method. This method works by storing a correction factor for each range on the DaqBoard/2000 series at the time of calibration. Whenever a particular range is selected, the appropriate calibration constant is automatically applied to a compensating DAC, thereby calibrating the specific range. The result is that readings generated by the A/D are already calibrated, and do not require additional processing.

This is significantly better than other boards, that merely adjust the readings in software after they are transferred to the PC. That method has the disadvantage of reducing the dynamic range of the A/D, and can adversely affect the speed by which the PC can obtain a calibrated reading.

The DaqBoard/2000 series also has a user-cal mode, whereby the user can adjust the calibration of the board in their system, without destroying the factory calibration supplied with the board. This is accomplished by having 2 distinct calibration tables in the DaqBoard/2000 series on-board EPROM, one which contains the factory cal, and the other which is available for user calibration.

Analog Output (P3)

DaqBoard/2000, /2001, /2003, & /2004 Only

Two or four 16-bit, 100-kHz analog output channels are built into the DaqBoard/2000 series, with an output from –10V to +10V. These outputs are entirely separate from the D/As which are used to determine analog trigger level (some data acquisition board suppliers confusingly refer to trigger D/As as if they are available to the user). Through the use of Bus Mastering DMA, each D/A output can continuously output a waveform, which can be read from PC RAM or a file on the hard disk. In addition, a program can asynchronously output a value to either of the D/As for non-waveform applications, presuming that the D/A is not already being used in the waveform output mode. Additional low-speed D/A channels can be added to the DaqBoard through the use of the DBK2 analog output option card (see p. 149).

When used to generate waveforms, the D/As can be clocked in several different modes. Each D/A can be separately selected to be clocked from one of the sources described below.

Asynchronous internal clock. The on-board programmable clock can generate updates ranging from 1.5 Hz to 100 kHz, independent of any acquisition rate.

Synchronous internal clock. The rate of analog output update can be synchronized to the acquisition rate derived from 100 kHz to once every 5.96 hours.

Asynchronous external clock. A user-supplied external input clock can be used to pace the D/A, entirely independent of analog inputs.

Synchronous external clock. A user-supplied external input clock can pace both the D/A and the analog input.

* Driver support only

DaqBoard/2000™ Series

General Information

Digital Pattern Generation (P3)

The DaqBoard/2000 series supports digital pattern generation via Bus Mastering DMA on the 16-bit high-speed digital I/O port. In the same manner as Analog Output, the digital pattern can be read from PC RAM or a file on the hard disk. Digital pattern generation is clocked in the same four modes as described above with analog output*.

Digital Inputs and Outputs (P2, P3)

Forty TTL-level digital I/O lines are included in the DaqBoard/2000 series. They are divided into three 8-bit ports (P2) and one 16-bit port (P3). The P2 ports can be programmed in 8-bit groups as either input or output. The 16-bit P3 port can be programmed as all inputs or all outputs. Ports programmed as inputs can be part of the scan group and scanned along with other analog and digital input channels, or can be asynchronously accessed via the PC at any time, including when a scanned acquisition is occurring.

In addition, the P2 ports can be expanded up to 256 digital I/O lines using external DBK digital options (p. 143). These options are available as TTL-level I/O, relay output, or optically isolated input and output. Whenever expansion digital I/O is attached to the DaqBoard/2000 series, the P2 I/O lines are no longer user-programmable, and are instead used to communicate with the digital expansion options.

Counter Inputs (P3)

Four 16-bit counters are built into the DaqBoard/2000, each capable of counting up to 65,536 TTL-level transitions. Each of the four counters will accept frequency inputs up to 10 MHz. The counters can also be cascaded, allowing over four billion counts to be accumulated. As with all other inputs to the DaqBoard/2000 series, the counter inputs can be read asynchronously under program control, or synchronously as part of an analog and digital scan group.

* When digital pattern generation is used, one of the analog output channels is limited to asynchronous output mode

DaqBoard/2000 Series Signal Conditioning & Expansion Options

Product	Description	Capacity	Page
DBK1	16-connector BNC interface module	16 connectors	148
DBK2	D/A voltage-output card	4 channels	149
DBK4	dynamic signal-input card	2 channels	150
DBK5	current output card	4 channels	152
DBK7	frequency-to-voltage input card	4 channels	154
DBK8	high-voltage input card	8 channels	156
DBK9	RTD measurement card	8 channels	157
DBK10	expansion-card enclosure module	3 cards	158
DBK11A	screw-terminal card	40 terminals	159
DBK15	universal current/voltage input card	16 channels	160
DBK16	strain gage measurement card	2 channels	162
DBK17	simultaneous sample and hold card	4 channels	164
DBK18	low-pass filter card	4 channels	166
DBK20	digital I/O card (screw-terminal connectors)	48 channels	168
DBK21	digital I/O card (male DB37 connectors)	48 channels	168
DBK23	optically isolated digital-input module	24 channels	169
DBK24	optically isolated digital-output module	24 channels	171
DBK25	relay output card	8 channels	173
DBK30A	rechargeable battery/excitation module	14.4 or 28.8 VDC	174
DBK32A	auxiliary power supply card	±15 VDC @ 500 mA	175
DBK33	triple-output auxiliary power supply card	±15 VDC @ 250 mA & ±5 VDC @ 1000 mA	175
DBK40	BNC interface module	18 connectors	177
DBK41	analog expansion enclosure module	10 cards	178
DBK42	5B isolated signal-conditioning module	16 channels	180
DBK43A	strain gage module	8 channels	182
DBK44	5B isolated signal conditioning card	2 channels	184
DBK45	SS&H card with low-pass filter	4 channels	186
DBK46	internal analog output card	4 channels	108
DBK50	isolated high-voltage input module	8 channels	188
DBK51	isolated low-voltage input module	8 channels	188
DBK60	3-slot expansion module w/customizable panels	3 cards	190
DBK70	vehicle network interface module	16 channels	192
DBK80	differential voltage input card with excitation output	16 channels	197
DBK81	TC/mV card with screw-terminal connections	7 channels	198
DBK82	TC/mV card with screw-terminal connections	14 channels	198
DBK83	TC/mV card with external screw-terminal Pod and 3 ft. cable	14 channels	198
DBK84	TC/mV module with mini TC connector jacks	14 channels	198
DBK200	adapter board for analog inputs	P1	121
DBK201	panel-mount adapter board with three (DBK) expansion ports	P1, P2, P3	121
DBK202	screw-terminal adapter board, solder locations for user-supplied resistors and R/C networks, with three expansion ports	120 terminals, P1, P2, P3	121
DBK203	same as DBK202 adapter board with a rugged metal enclosure	120 terminals, P1, P2, P3	121
DBK206	adapter board with removable screw-terminals with three expansion ports	120 terminals, P1, P2, P3	122
DBK207	5B-isolated analog input signal conditioning board with two expansion ports	P1 (2)	201
DBK207/CJC	same as DBK207 plus on-board, cold-junction compensation; two expansion ports	P1 (2)	201
DBK208	Opto-22® signal conditioning board for isolated (solid-state-relay) digital I/O, with two P2 digital I/O expansion ports	P2 (2)	203
DBK209	same as DBK201 but rack and DIN-rail mountable with optional kits	P1, P2, P3	121

Timer Outputs (P3)

Two 16-bit timer outputs are built into the DaqBoard/2000, each capable of generating different square waves with a programmable frequency range from 16 Hz to 1 MHz.

Multiple DaqBoards per PC

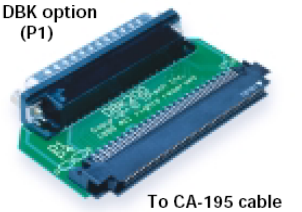
All of the features described for the DaqBoard/2000 can be replicated with up to four DaqBoard/2000s (PCI and cPCI) installed in the same PC. The serial number on each DaqBoard/2000 is used to differentiate one from another, and a user-selected name can be assigned to each board for easy program documentation. Thus, with four boards installed along with DBK expansion options, over 1,000 analog input channels and over 1,000 digital I/O channels could be accessed from one PC. When multiple boards are installed, all boards can be operated synchronously.

DaqBoard/2000™ Series

Connectivity Options

The DaqBoard/2000 series provides all I/O signals on one 100-pin connector. The following adapter options make it easy for the user to attach signals and expansion options to the DaqBoard/2000 series.

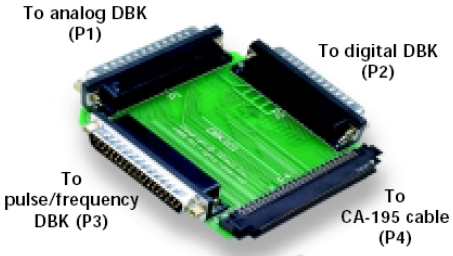
Note: The following boards are not depicted with respect to scale.



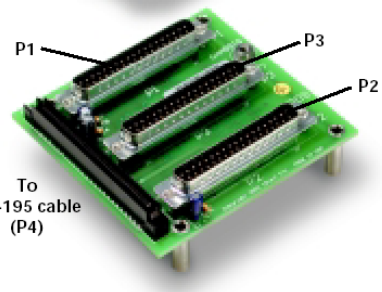
DBK200™ Adapter Board

Suitable exclusively for analog-signal expansion, the DBK200 adapter board contains one 100-pin connector which connects to the DaqBoard/2000 series via the CA-195 cable, and one female DB37 connector that mates directly with the P1 port of any of the DBK analog signal conditioning and expansion options. This is the most convenient way to add analog expansion options if access to the DaqBoard/2000 series digital I/O or frequency signals is not required. Access to P1 analog signals is also possible via included female-mating solder-lug connectors or optional CA-37-x* or CA-37-xT* expansion cables.

DBK201



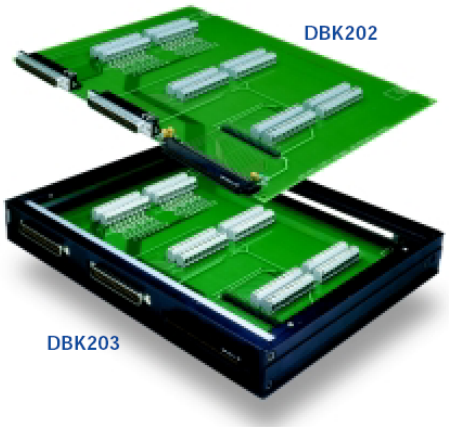
DBK209



DBK201™ & DBK209™ Adapter Boards

For both analog and digital expansion, the DBK201 adapter board mates with the DaqBoard/2000 series via a 3-ft. CA-195 cable. The DBK209 provides three male DB37 connectors, divided into P1 analog input, P2 digital I/O, and P3 analog output and counter/timer I/O. Each port on the DBK201 connects to DBK expansion options via an optional CA-37-x* or CA-37-xT* expansion cable. Alternatively, users can solder wires to the included DB37 female-mating solder-lug connectors, or custom make their own cables that are terminated with a female DB37. An optional 6-ft. cable is available that contains a mating female DB37 connector at one end, and is unterminated at the other end (CA-113). The DBK209 is identical in function to the DBK201 but is snap-track (DIN-rail), and rack-mountable with optional mounting kits.

The CA-195 100-pin conductor cable connects the DaqBoard/2000 series boards with the DBK200 series adapters



DBK202™ Screw-Terminal Adapter Board

The DBK202 screw-terminal board provides convenient screw-terminal access to all signals from the DaqBoard/2000 series. Divided into three ports (P1, P2, and P3), the DBK202 also provides another way to access signals. There are male DB37 connectors on P1 and P2, and an adapter cable (CA-60) can be used to connect to the P3 header for connection to DBK signal conditioning and expansion options. Mounting holes in the DBK202 permit it to be easily screw-mounted into a user-provided enclosure.

DBK203™ Screw-Terminal Adapter Module

The DBK203 is identical to the DBK202, except that it is housed in a shielded metal enclosure, which easily mounts to other DBK signal conditioning and expansion modules. Optional fastener panels are available for attaching other DBK modules.

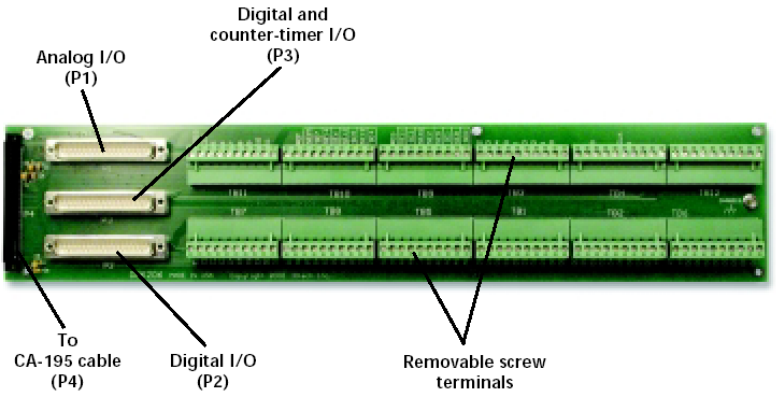
* The "x" in the cable part numbers should be replaced by the number of expansion products to be connected

DaqBoard/2000™ Series

Connectivity Options

DBK206 Screw-Terminal Adapter Board

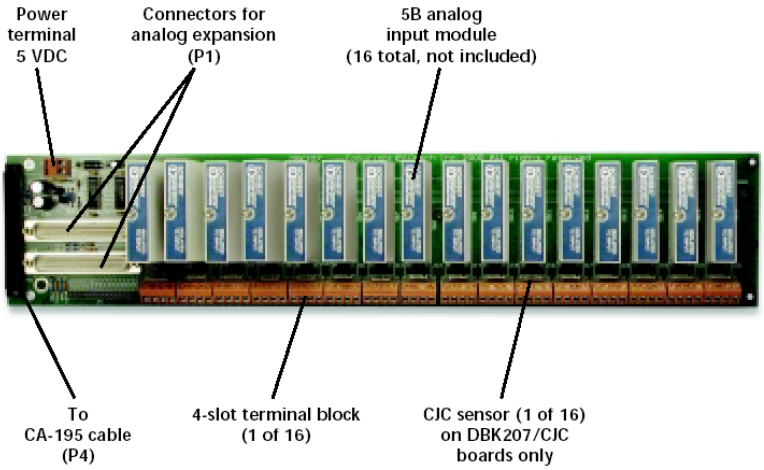
Similar in function to the DBK202, but designed for mounting in 19-inch enclosures, the DBK206 features three vertically mounted straight male DB37 connectors for analog and digital channel expansion (P1 analog I/O, P2 digital I/O, and P3 digital and counter-timer, and analog output). Two rows of removable screw terminals provide convenient access to all DaqBoard/2000 series I/O signals (10-22 AWG wire). It mates with the DaqBoard/2000 series via a 3ft. CA-195 cable, and each port (P1, P2, and P3) connects to DBK signal conditioning and expansion options via optional CA-37-x cable(s). The standard DBK206 can be panel mounted, but it also is DIN-rail mountable with option DIN2 and is rack-mountable with option Rack3 (see p. 123).



DBK207 & DBK207/CJC™ Multiplexing Isolated Analog Input Board

The DBK207 provides sockets for 16 channels of isolated analog input when populated with industry standard 5B-style or compatible signal conditioning modules (sold separately, see p. 205). Each channel features screw-terminals and sockets for current conversion resistors (supplied with 5B current input modules). The DBK207/CJC features added cold-junction compensation per channel for thermocouple-based measurements.

Multiplexing is built-in allowing up to 16 DBK207 boards to be directly connected to one DaqBoard/2000 series board for a total signal capacity of 256 isolated analog inputs. The 100-pin P4 connector on the DBK207 attaches directly to the DaqBoard (via CA-195 cable). Two DB37 connectors permit daisy chaining to other DBK207 boards, and to any of the other DBK analog signal conditioning boards and modules. The DBK207/CJC and the DBK207 can be rack or snap-track mounted with optional mounting kits. See p. 123 for complete information on the DBK207 and DBK207/CJC.



DaqBoard/2000™ Series

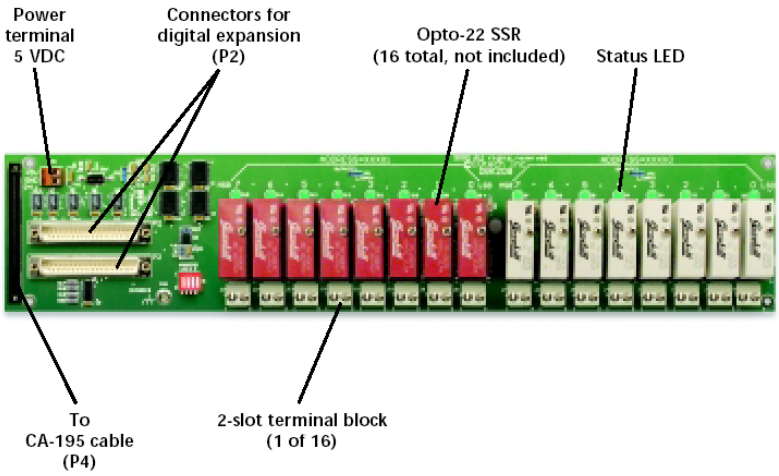
Connectivity Options

DBK208™ Multiplexing Isolated Digital I/O Board

The DBK208™ provides sockets for 16 channels of isolated digital I/O when populated with industry standard Opto-22®-style or compatible solid-state-relay modules (sold separately, see p. 207). Each socket also features screw-terminals and an LED to indicate logic status. The 16 digital I/O can be jumper configured as either inputs or outputs in 8-channel groups.

Multiplexing is built-in allowing up to 16 DBK208 boards to be connected to one DaqBoard/2000 series board, for a total signal capacity of 256 isolated digital I/O channels. On-board logic insures that outputs are disabled during power-up and by a computer (CPU) reset. Also included is the ability to choose whether outputs are "off", or in the "last known state" when loss of external power occurs.

The 100-pin P4 connector on the DBK208 attaches directly to a DaqBoard/2000 series board (via CA-195 cable) while two DB37 connectors permit daisy chaining to other DBK208 boards, and to any of the other DBK digital boards and modules. See p. 203 for complete information on the DBK208.



Rack3™ Rack-Mount Kit

Rack-mount kit for the DBK206, DBK207, DBK207/CJC, DBK208, and DBK209 signal termination and expansion boards.

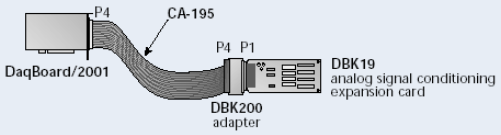
DIN1™ & DIN2™ DIN-Rail Kit

Snap-track (DIN-rail) mounting kit for the DBK206, DBK207, DBK207/CJC, and DBK208 signal termination and expansion boards. Specify DIN2 for DBK209 only.

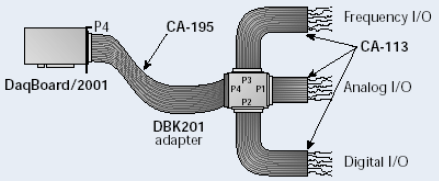
DaqBoard/2000™ Series

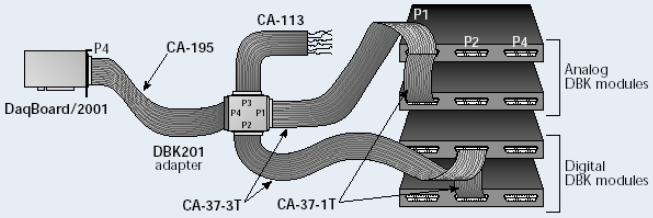
Connectivity Options

System Configuration Examples

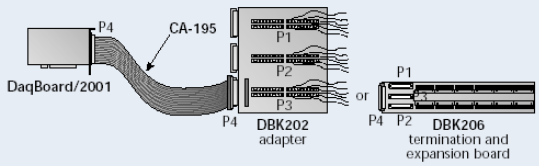


The DBK200 adapter mates directly with analog DBK signal conditioning options

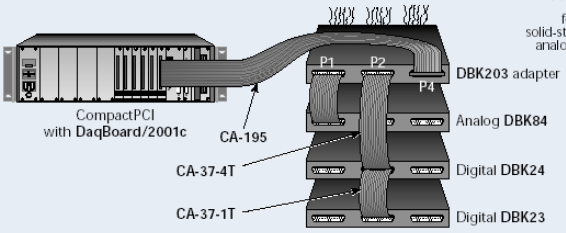




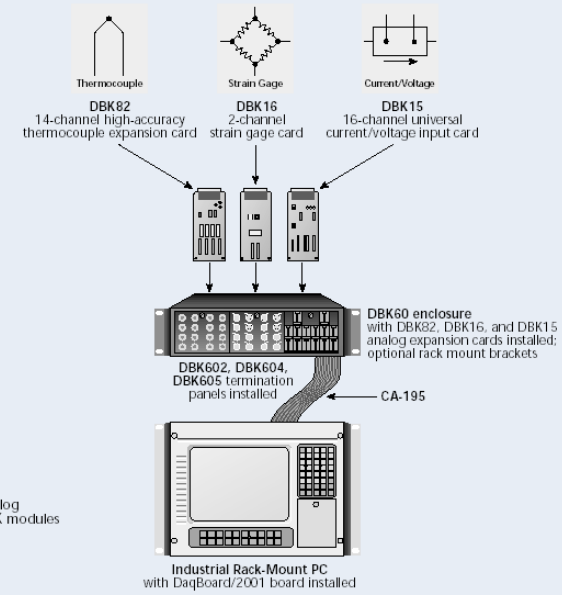
The DBK201 adapter with analog and digital DBK signal conditioning and expansion modules



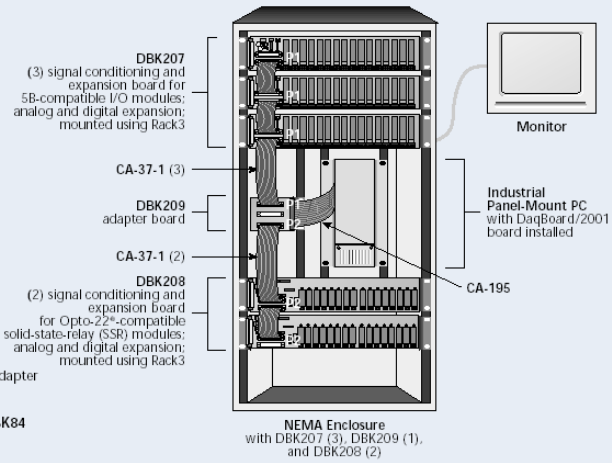
The DBK202 or DBK206 (P1, P2, P3) adapter with screw-terminal connectors



The DBK203 adapter with screw-terminal connectors



The DBK60 ruggedized rack-mount enclosure with optional signal conditioning and termination panels



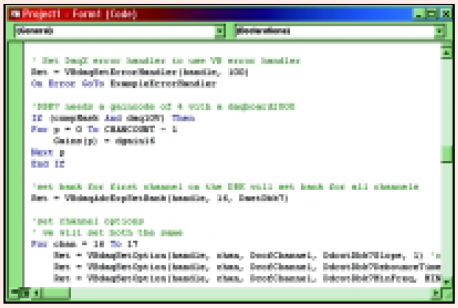
The DBK209 adapter with DBK207 and DBK208 isolated analog input and digital I/O signal conditioning and expansion boards (16 max), with Rack3 mounting option

Software Support

Included Software for DaqBoard/2000™ Series

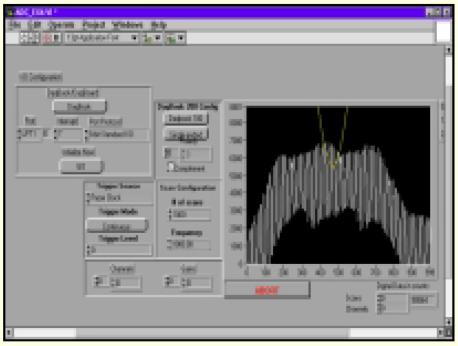
The DaqBoard/2000™ series is supported by several levels of software support, allowing you to select the software environment that best fits your application and skill set. On this page is a description of the software that is included with every DaqBoard/2000. The next page is an overview of optional software available for the DaqBoard/2000.

DaqX Subroutine API Libraries



DaqBoard/2000 series is supplied with free DaqX Subroutine API Libraries providing complete support for all of the functionality available on each data acquisition device in Visual Basic®, C/C++, and Delphi™. Further, DaqX is supported under all versions of Windows®. Included with DaqX Subroutine API Libraries are over 100 example programs, and comprehensive API documentation is provided through an online programmers manual.

LabVIEW® Support



IOtech offers extensive LabVIEW® support for the DaqBoard/2000 series, including expansion and signal conditioning modules. IOtech data acquisition VIs for LabVIEW are more than just simple hardware access VIs, they are full blown examples complete with engineering data conversion, data display and logging capabilities.

Linux for the DaqBoard/2000™ Series

Features

- **Support for all DaqBoard/2000 PCI Series products including the CompactPCI product lines**
- **Support for all DBK digital and analog expansion cards and modules**
- **Over 50 example programs in C using the features of the DaqBoard/2000 series as well as most DBK expansion modules.**
- **Source is available for user modification and customization**
- **Support for multiple DaqBoard/2000 series devices**

Linux drivers for the DaqBoard/2000 series products provide an effective and robust alternative for non-Windows based data acquisition applications. IOtech's Linux drivers for the DaqBoard/2000 series products include support for all DBK series expansion as well as extensive example programs for most DBKs and features provided by the DaqBoard/2000 series products.

- Synchronous scanning of Analog, Digital Input and Counter input channels up to 200 kHz
- Asynchronous I/O operations for Digital I/O, Counter Input and Analog output channels
- Synchronous streamed Analog Waveform and Digital Pattern output up to 100 kHz
- Analog, Digital and Counter channel Start Trigger and Stop Trigger events
- DBK expansion support for expansion and signal conditioning options, including temperature (TC and RTD), high voltage, frequency input, strain gage, digital I/O, and 5B options
- Sophisticated buffering features allow the application to collect acquired data in a variety of ways
- Over 50 example programs written in C using all the features of the DaqBoard/2000 Series along with examples for most DBK expansion and signal conditioning cards and modules
- Tunable input update rate allows the application to optimize throughput and I/O turn-around times

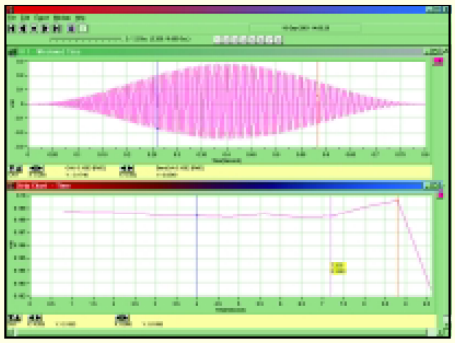
Software Support

Optional Software for DaqBoard/2000™ Series

DaqView2000™ & eZ-PostView™

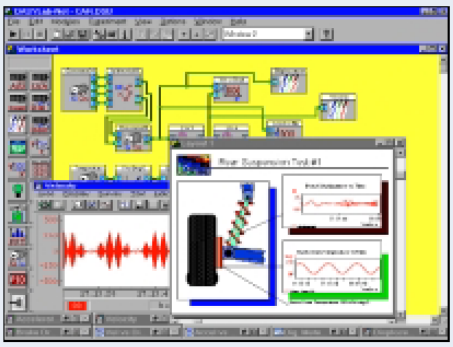
DaqView2000™ graphical data acquisition and display software is available for all DaqBoard/2000 series systems. Using DaqView software's spreadsheet-style interface, you can easily set up your application and begin taking data within minutes of connecting your hardware, with no programming required (see p. 138). Included with DaqView2000 is eZ-PostView which makes it simple to visually inspect acquired waveforms from multiple channels within seconds of acquiring the data. See p. 228 for complete information.

eZ-TimeView™ & eZ-FrequencyView™



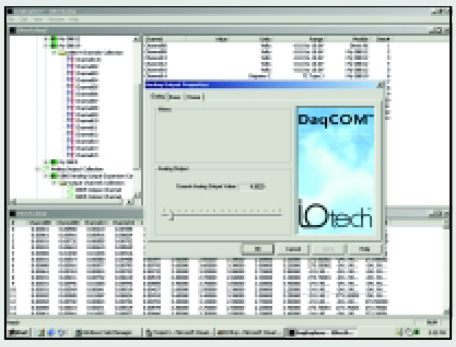
eZ-TimeView™ and eZ-FrequencyView™ are post-acquisition analysis packages for data acquired from the DaqBoard/2000 series. eZ-TimeView is targeted at time-domain analysis, including min/max, peak-peak, mean, RMS, plus a wide variety of plotting and waveform viewing capabilities. eZ-FrequencyView is targeted at post-acquisition frequency-domain analysis, including FFT's, octave analysis, plus dozens of other analysis features. See p. 229-230 for complete information.

DASYLab®



If your application requirements go beyond the scope of DaqView™, DASYLab® software offers a greater degree of flexibility and customization. You can learn DASYLab in a matter of days, without the weeks of training required for some other icon-based application-development software. See p. 223 for complete information.

DaqCOM™ ActiveX/COM Support



The DaqCOM™ suite of programming allows applications developers to rapidly develop and deploy custom systems by leveraging COM (Component Object Model) technology. DaqCOM does this by providing a powerful easy-to-use interface to most programming languages including, Visual Basic®, VBA, C++, Delphi™ and J++. In addition, DaqCOM supports the new Windows.NET architecture and includes examples for VisualBasic.NET and C. See p. 221 for complete information.

DaqBoard/2000™ Series

Specifications

Specifications

General (all boards)

Power Consumption (per board): 3.5W (up to 10W with external accessories)
Power Available for External Signal Conditioning and Expansion Options: 5V at 1A (all boards); ±15V at 75 mA each (except for /2002)
Operating Temperature: 0° to +60°C
Vibration: MIL STD 810E
Signal I/O Connector: 100-pin high-density edge-type carries all analog and digital I/O signals
Dimensions: 165 mm W x 15 mm D x 108 mm H (6.5" x 0.6" x 4.2")

Analog Inputs (/2000, /2001, & /2005)

Channels: 16 single-ended or 8 differential, programmable on a per-channel basis as single-ended or differential and unipolar or bipolar
Expansion: Up to 256 channels per board (4 boards per PC), without degradation in maximum channel-to-channel scan rate (5 µs/channel)
Bandwidth: 500 kHz
Settling Time: 5 µs to 1 LSB for full-scale step
Maximum Input Voltage: ±11V relative to analog common
Over-Voltage Protection: ±35V
Ranges: Software or sequencer selectable on a per-channel basis

Voltage Range*	Accuracy** One Year, 0-35°C (% reading+% range)	
	Absolute	Transfer†
0 to +10V	0.015 + 0.005	0.004 + 0.002
0 to +5V	0.015 + 0.005	0.004 + 0.002
0 to +2.5V	0.015 + 0.005	0.004 + 0.002
0 to +1.25V	0.015 + 0.008	0.004 + 0.002
0 to +0.625V	0.015 + 0.008	0.004 + 0.002
0 to +0.3125V	0.015 + 0.008	0.004 + 0.003
-10 to +10V	0.015 + 0.005	0.004 + 0.001
-5 to +5V	0.015 + 0.005	0.004 + 0.001
-2.5 to +2.5V	0.015 + 0.005	0.004 + 0.001
-1.25 to +1.25V	0.015 + 0.005	0.004 + 0.001
-0.625 to +0.625V	0.015 + 0.008	0.004 + 0.001
-0.3125 to +0.3125V	0.015 + 0.008	0.004 + 0.0015
-0.156 to +0.156V	0.02 + 0.008	0.004 + 0.0015

* Specifications assume differential input single channel scan, 200-kHz scan rate, unfiltered
** Accuracy specification is exclusive of noise
† Transfer accuracy assumes calibration inside computer; applicable for measurements made 5°C from ambient temperature at calibration

A/D Specifications (/2000, /2001, & /2005)

Type: Successive approximation
Resolution: 16 bit
Conversion Time: 5 µs
Maximum Sample Rate: 200 kHz
Nonlinearity (Integral): ±1 LSB
Nonlinearity (Differential): No missing codes

Input Sequencer (/2000, /2001, /2002, /2004, & /2005)

Analog, digital and counter inputs can be scanned synchronously, based on either an internal programmable timer, or an external clock source. Analog and digital outputs can be synchronized to either of these clocks.
Scan Clock Sources: 2
1. Internal, programmable from 5 µs to 5.96 hours in 5 µs steps
2. External, TTL level input up to 200 kHz max

Programmable Parameters per Scan: Channel (random order), gain, unipolar/bipolar
Depth: 512 location
On-Board Channel-to-Channel Scan Rate: 5 or 10 µs per channel, programmable
Expansion Channel Scan Rate: 5 or 10 µs per channel, programmable

External Acquisition Scan Clock Input (/2000, /2001, & /2005)

Maximum Rate: 200 kHz
Clock Signal Range: 0V to +5V
Minimum Pulse Width: 50 ns high, 50 ns low

Triggering

Trigger Sources: 6, individually selectable for starting and stopping an acquisition. Stop acquisition can occur on a different trigger source other than start acquisition, and can be triggered via modes 2, 4, 5, or 6. Pre-trigger is supported with fixed or variable pre-trigger periods.
1. Single-Channel Analog Hardware Trigger
   Latency: 5 µs max (/2000, /2001, & /2005)
2. Single-Channel Analog Software Trigger
   Latency: One scan period max (/2000, /2001, & /2005)
3. Single-Channel Digital Trigger
   Latency: 5 µs max (/2000, /2001, /2002, /2004, & /2005)
4. Digital Pattern Triggering
   Latency: One scan period max (/2000, /2001, /2002, /2004, & /2005)
5. Counter/Totalizer Triggering (/2000, /2001, /2002, /2004, & /2005)
   Latency: One scan period, max (all boards)
6. Software Triggering (all boards)
   Trigger can be initiated under program control.

Analog Outputs (/2000, /2001, /2003, & /2004)

The two or four analog output channels are updated synchronously relative to scanned inputs, and clocked from either an internal onboard clock, or an external clock source. Analog outputs can be updated asynchronously, independent of any other scanning in the system. Bus Mastering DMA provides CPU and system-independent data transfers, ensuring accurate outputs independent of other system activities. Streaming from disk or memory is supported, allowing continuous, nearly-infinite length, waveform outputs (limited only by available PC system resources).
Channels: 2 (/2000); 4 (/2001, /2003, & /2004)
Resolution: 16 bits
Output Voltage Range: ±10V
Clock Sources: 4, programmable
1. Onboard D/A clock, independent of scanning input clock
2. Onboard scanning input clock (/2000, /2001, & /2004 only)
3. External D/A input clock, independent of external scanning input clock
4. External scanning input clock (/2000, /2001, & /2004 only)

Digital I/O (/2000, /2001, /2002, /2004, & /2005)

Channels: 40, expandable up to 208 with DBK options
Input Scanning Modes: 2, programmable
1. Asynchronous, under program control at anytime
2. Synchronous with input scanning

Ports: 3 x 8-bit (82C55 emulation), and 1 x 16-bit. Each port is software programmable as input or output
Input Characteristics: 100 Ohm series, 20 pF to common
I/O Levels: TTL
Sampling/Update Rate: 200 kHz max
Output Characteristics: Output 12 mA per pin, 200 mA total continuous (per bank of 40 outputs)

Pattern Generation Output (/2000, /2001, /2002, /2004, & /2005)

The P3 16-bit digital I/O port can be configured for 16-bit pattern generation. The pattern can be updated synchronously with an acquisition.

Counter (/2000, /2001, /2002, /2004, & /2005)

Counter inputs can be scanned synchronously along with analog and digital scanned inputs, based either on internal programmable timer, or an external clock source. Counter can also be read asynchronously.
Channels: 4 x 16-bit; cascadable as 2 x 32-bit
Frequency Measurement Rate: 10 MHz max
Trigger Level: TTL

Frequency/Pulse Generators (/2000, /2001, /2002, /2004, & /2005)

Channels: 2 x 16-bit
Output: 1-MHz base rate divided by 1 to 65,535 (programmable)

DaqBoard/2000™ Series

Ordering Information

Ordering Information

Description	Part No.
16-bit, 200-kHz data acquisition board for PCI-bus PCs with 16 analog inputs, two 16-bit, 100 kHz analog outputs, 40 digital I/O, four 16-bit counter-timers, and two 16-bit frequency/pulse generators; includes DaqX API library, drivers for Visual Basic®, C++, and Delphi™ for Windows® 95 and higher; C++ for Linux, DASYLab®, TestPoint®, & LabVIEW®	DaqBoard/2000
CompactPCI version	DaqBoard/2000c
Same as DaqBoard/2000 but with four 16-bit, 100-kHz analog outputs	DaqBoard/2001
CompactPCI version	DaqBoard/2001c
Same as DaqBoard/2001 but with no analog I/O	DaqBoard/2002
CompactPCI version	DaqBoard/2002c
Data acquisition board for PCI-bus PCs with four 16-bit, 100-kHz analog outputs	DaqBoard/2003
CompactPCI version	DaqBoard/2003c
Same as DaqBoard/2001 but with no analog inputs	DaqBoard/2004
CompactPCI version	DaqBoard/2004c
Same as DaqBoard/2001 but with no analog outputs	DaqBoard/2005
CompactPCI version	DaqBoard/2005c
DaqBoard/2000, DaqView2000 software, DBK202, and CA-195	DAQ2000/STR-KIT

Accessories

Adapter board, directly connects DBK signal conditioning and expansion options (P1, analog only) to a CA-195 or CA-209 expansion cable	DBK200
Adapter board, connects all DBK signal conditioning and expansion options to a CA-195 or CA-209 expansion cable	DBK201
Adapter board with screw terminals, also connects DBK signal conditioning and expansion options to a CA-195 or CA-209 expansion cable	DBK202
Same as DBK202 but housed in a shielded metal enclosure	DBK203
Termination and expansion board with removable screw terminals for access to all DaqBoard/2000 series I/O with direct connection for DBK signal conditioning and expansion options (P1, P2 and P3 for analog and digital I/O) via CA-37-1 cable(s); connects to DaqBoard/2000 series P4 connector via a CA-195 or CA-209 cable	DBK206
Termination and (P1) expansion board with fixed screw terminals and sockets for up to 16 multiplexed SB-compatible isolated analog input modules; connects to DaqBoard/2000 series (P4) connector via a CA-195 or CA-209 cable and to LogBook or DaqBook series devices (P1) connector via CA-37-1	DBK207
Same as DBK207 but with on board, cold-junction compensation and two (P1) expansion ports	DBK207/CJC
Termination and expansion board with fixed screw terminals (12 to 26 AWG wire), sockets for up to sixteen Opto-22®-compatible isolated solid-state-relay (SSR) digital I/O modules, and status LEDs per channel; connects to DaqBoard/2000 series P4 connector via a CA-195 or CA-209 cable	DBK208
Same as DBK201 but rack and DIN-rail mountable with optional kits	DBK209
Rack-mount kit for DBK206, DBK207, DBK207/CJC, DBK208, and DBK209 signal termination and expansion boards	Rack3
DIN-rail adapter kit for DBK206, DBK207, DBK207/CJC, and DBK208 signal termination and expansion boards	DIN1
DIN-rail adapter kit for DBK209 signal termination and expansion board	DIN2
Optional hardcopy manual set (3); includes programmer's manual, DaqBoard/2000 & DaqBoard/2000c series user's manual, and DBK option cards & modules user's manual	1033-0900

Cables

Expansion-card cable for connecting DBK series expansion options; specify number of option cards (x) to be connected	CA-37-x
Ribbon cable with female DB37 connector, provides convenient wiring to P1, P2, and P3 ports without requiring soldering to DB37 connectors, 6 ft.	CA-113
100-conductor expansion cable, mates with the DaqBoard/2000 series boards and the DBK200, DBK201, DBK202, DBK203, DBK206, DBK207, DBK207/CJC, DBK208, and DBK209;	
3 ft. expansion cable	CA-195
6 ft. expansion cable	CA-195-6
Same as CA-195 with CE compliance; 3 ft.	CA-209

Software

DaqView™ for setup, data acquisition, display, and analysis; DaqViewXL™ for seamless execution within Microsoft® Excel's tool palette, and eZ-PostView™ for post-acquisition viewing and analysis	DaqView2000
Icon-based data acquisition, graphics, control, and analysis software	DASYLab
ActiveX/COM-based applications program interface	DaqCOM
DaqCOM™ with network support	DaqCOM/NET
Data acquisition grid control for Visual Basic	DaqCOM/OCX
Post-acquisition time-domain analysis software for data acquired from the DaqBoard/2000	eZ-TimeView
Post-acquisition fequency-domain analysis software for data acquired from the DaqBoard/2000	eZ-FrequencyView

PCI Watchdog Timers for Windows NT CE

Introduction

The PCI Watchdog Timer Cards are designed to overcome the dangers or annoyances associated with PCs locking up. The NT device driver will try a software reboot before it does a hardware reboot, saving the time it takes to get your server back on line. PCs used in remote or dial-up applications, to control external devices, or performing data acquisition can all benefit from a watchdog. If the controlling software hangs or crashes, the watchdog will timeout and reset the computer. The application software must reset the card's counter every timeout period to prevent the watchdog from rebooting the computer. The PCI watchdogs have a SPDT Form C Relay output to allow an external device or alarm to be controlled.
Model **PCIRWDT** uses the reset lines from the motherboard to reset the computer.
Model **PCIXWDT** uses the ATX/ATX12V power supply to turn the computer off for 10 seconds, then turn it on again causing the computer to reset.

Features

- Software selectable timeout period from 0.5 to 512 seconds. Range can be increased with hardware modifications
- 4 bit read/write timeout register
- Software enable and disable
- Form C relay output to control external device
- PCIRWDT: Non-splicing connection to the motherboard's reset pins
- PCIXWDT: Non-splicing connection to ATX/ATX12V power supply

Specifications

O/S:	Win 98, 2000, ME, NT
Dimensions:	2.5H x 6.9L in (6.35 x 17.5 cm)
Address:	PCI Plug and Play
Power:	1.5W maximum
Output spec:	Form C Relay, SPDT output Maximum ratings 24 VDC at 1.0 A 115 VAC at 0.5 A
Connector:	DB-9 male

Connections

In order for the PCIRWDT to reboot the host computer, a connection must be made to the reset pins on the motherboard in parallel with the reset switch. A jumper wire is provided with the PCIRWDT to make this connection. Note that some PCs do not include these pins on the motherboard.

In order for the PCIXWDT to restart the host computer, a connection must be made between the ATX/ATX12V power supply and the PCIXWDT. A jumper wire is provided with the PCIXWDT to make this connection. Note that some PCs do not have the ATX/ATX12V power supply. The ATX/ATX12V power supply will be a single 20-pin connector to the motherboard. If there are two connectors from the power supply to the motherboard this is not an ATX/ATX12V power supply. An additional Form C Relay output connection can be made through the DB9 connector to an external alarm or to shut down another device.

DECLARATION OF CONFORMITY

Manufacturer's Name:	B&B Electronics Manufacturing Company
Manufacturer's Address:	P.O. Box 1040 707 Dayton Road Ottawa, IL 61350 USA
Model Numbers:	PCIRWDT, PCIXWDT
Description:	PC Watchdog Timer for Windows NT
Type:	Light industrial ITE equipment
Application of Council Directive:	89/336/EEC
Standards:	EN55022 EN50082-1: EN61000 (-4-2, -4-3, -4-4, -4-6)

William H. Franklin III, Director of Engineering

Operation

A program calls a DLL function from Windows NT to write to the PCI watchdog device driver. The device driver will then write or read from the watchdog. When the timeout is reached the device driver will try a software reboot. If this fails the PCI watchdog will do a hardware reboot.

Software

The PCIXWDT and PCIRWDT come with the NT device driver and sample code.

B&B's Watchdog Family Selection Guide

Model	Bus	Timeout Register	Operating System	Output Relay Connecter	Reboot Connector
ATRWDT	ISA	4-bit, read-write, 1-bit reset flag	DOS, Win 9x, Windows NT	DB9 Male	Motherboard reset pins
ATXWDT	ISA	4-bit, read-write	DOS, Win 9x, Windows NT	DB9 Male	ATX/ATX12V Power Supply Connector
PCWDT	ISA	4-bit, write only	DOS, Win 9x, Windows NT	DB25 Male	Motherboard reset pins
PCIRWDT	PCI	4-bit, read-write, 1-bit reset flag	Windows 98/2000/ME/NT	DB9 Male	Motherboard reset pins
PCIXWDT	PCI	4-bit, read-write	Windows 98/2000/ME/NT	DB9 Male	ATX/ATX12V Power Supply Connector
