Canada

Road Safety in Canada: A Shared Responsibility

In Canada, responsibility for road safety is shared among the federal, provincial/territorial and municipal levels of government. The federal government is responsible for new motor vehicle safety standards (*the Motor Vehicle Safety Act*), as well as interprovincial commercial vehicle safety fitness (*the Motor Vehicle Transport Act*).

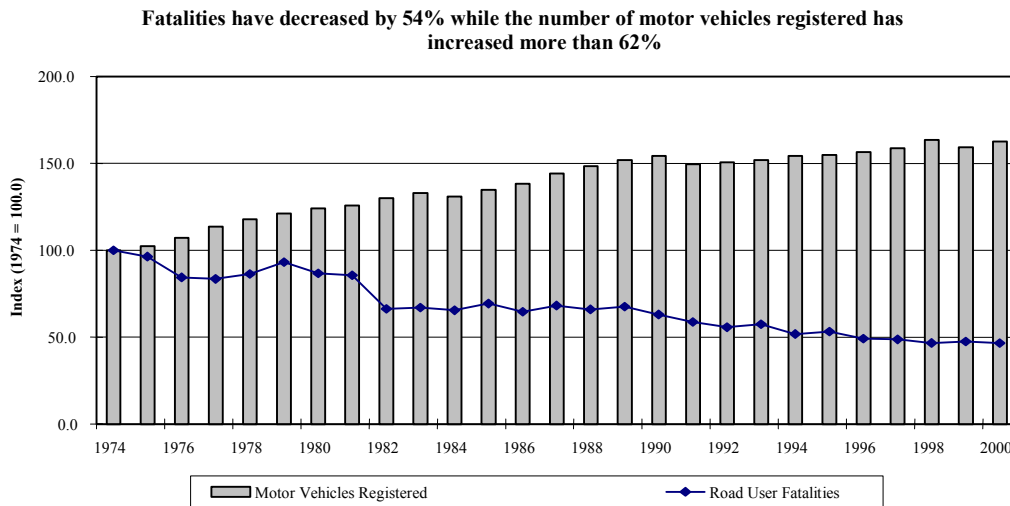

Provinces, territories and municipalities are responsible for highway development and maintenance, commercial vehicle operations, driver and vehicle licensing and the development and implementation of local safety initiatives. The Canadian Council of Motor Transport Administrators along with key non-governmental agencies, such as the Canadian Association of Chiefs of Police and the Canadian Automobile Association, also play an important role in the development and delivery of safety programs.

Canadians are among the most mobile people on earth

Motor vehicles help Canadians overcome two fundamental features of the country: vast geography and harsh climate. Our country has more than 1,420,000 kilometres (two-lane equivalent kilometres) of roadway, and the roads are busier than ever.

Canada had almost 21 million licensed drivers in 2000 - 10 million more than in 1974, a 79 percent increase compared to an increase in the population of 35 percent. In 2000, Canadians registered 17.9 million road motor vehicles - 7.0 million more vehicles than in 1974, a 63 percent increase.

Travel is safer than it has been in 25 years

Despite steady increases in the number of drivers and vehicles, travel on Canadian roads is safer today than ever before.

Traffic fatalities in 2000 were less than half of the 6,290 deaths in 1974 and were at the lowest level since 1954. For the last few years, the number of persons injured hovered around the 220,000 mark, but increased in 2000 to 227,500. Throughout the 1990s, Canada's safety record continued to improve. During this decade, fatalities resulting from collisions decreased 26 percent and injuries dropped 13 percent.

**Fatalities per 10,000 Motor Vehicles Registered (MVR)
1995-1999 Average Compared to 2000**

In the chart above, the territory of Nunavut (with a fatality rate in 2000 of 10.4) was omitted in order to avoid obscuring the fatality rates for the other jurisdictions. In terms of fatalities per 10,000 motor vehicles registered, the downward trend continued.

The fatality rates remained unchanged or were lower in 2000 compared to the 1995 to 1999 average in ten of the twelve jurisdictions shown. Ideally, the fatality rates for each jurisdiction would be calculated based on distance travelled to provide a measure of exposure to risk. Vehicle kilometres travelled were available for the first time for 2000 from the Canadian Vehicle Survey (Statistics Canada) for each province and territory.

Fatalities per 100 Million Vehicle-Kilometres Travelled in 2000

Despite huge improvements in road safety, nearly 3000 Canadians die on the roads every year

Improvements notwithstanding, casualty figures are a grim reminder of the high price Canadians pay for their mobility. Traffic fatalities accounted for 93 percent of transportation fatalities nationwide in 2000. Traffic collisions in Canada claimed the lives of 2,926 road users and injured another 227,403 in 2000.

Comparison of Fatalities by Mode of Transportation, 2000

A profile of collisions in Canada

In Canada, there were approximately 1,700 motor vehicle collisions every day during 2000, of which about 75 percent resulted in property damage only, and 25 percent involved an injury or a death.

The human toll is great. In 2000, eight people died on our roads every day, and 623 were injured, at a cost to society of approximately \$26 million in current dollars each day. The dollar amount was calculated based on the assumptions that the costs of a fatality and an injury were \$1.5 million and \$11,000, respectively, in 1991.

Single-vehicle collisions accounted for half of all fatal collisions

On average for the past 10 years, single-vehicle collisions accounted for 50 percent of all fatal collisions, 31 percent of collisions involving personal injury and 25 percent of property damage collisions.

Two-thirds of fatal collisions occurred on rural roads

Most deadly collisions took place on rural roads - primary and secondary highways and local roads where speed limits exceed 60 km/hr (usually 80-90 km/hr). Approximately 67 percent of the 2,566 fatal collisions occurred on rural roads in 2000. Of all injury collisions, 42,700 or 28 percent occurred on rural roads, while the majority occurred in urban areas where the posted speed limit was 60 km/h or less.

Motor Vehicle Traffic Collisions 1991-2000

Year	Fatal	Non-Fatal Injury	Property Damage	Total Collisions
1991	3,228	170,693	535,484	709,405
1992	3,073	169,640	516,666	689,379
1993	3,121	168,106	504,323	675,550
1994	2,869	166,780	505,027	674,676
1995	2,854	164,190	495,379	662,423
1996	2,708	156,282	476,422	635,412
1997	2,647	150,118	465,953	618,718
1998	2,612	148,414	450,286	601,312
1999	2,636	151,110	442,816	596,562
2000	2,566	155,933	463,409	621,908

Three out of four serious collisions occurred in clear weather

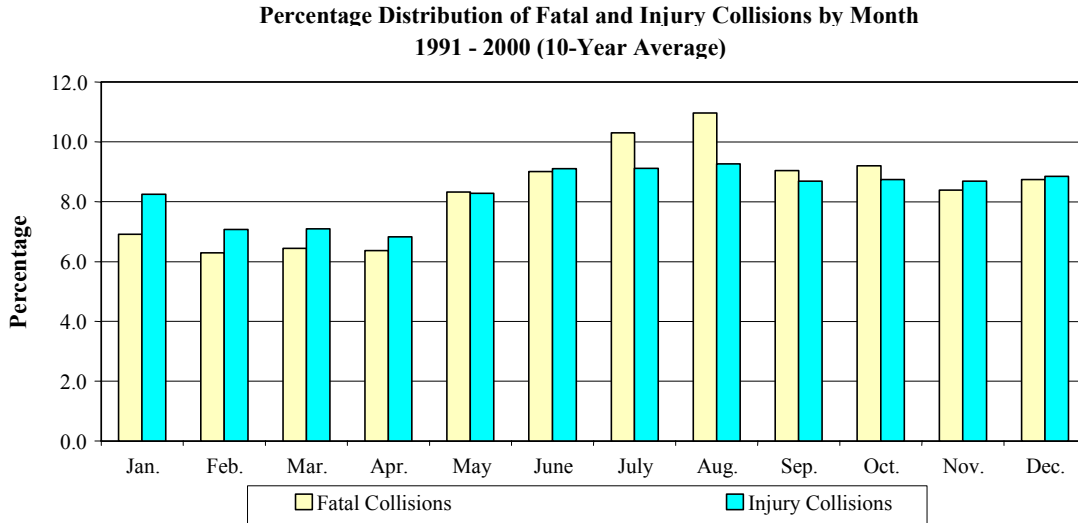

Many people blame Canada's weather and its road conditions for traffic deaths and injuries. But, in fact, the majority of collisions causing death and injury occurred in clear weather on straight, level roads with a dry road surface. More than half of fatal collisions and two thirds of the injury collisions occurred on such roads and the proportion of crashes on these roads has been on the increase.

Almost one in five fatal collisions occurred on Saturday

A single three-hour time period, from 3 p.m. to 6 p.m., posed the highest risk for fatal crashes and those producing injuries. This high-risk time period was even riskier on weekends. Saturday was the peak day for fatal collisions, although the period from midnight to 3:00 a.m. was the most risky. Friday was the peak day for injuries. Fewer serious crashes occurred on weekdays, with Monday the safest day by a slight edge.

July and August observed the highest frequencies of fatal collisions

On average, the peak months for fatal collisions were July and August. Injury collisions were also consistent: injury collisions involving two vehicles peaked in June, July and August, while single-vehicle injury collisions often peaked in November and December.

Vehicles In Collisions

The number of motor vehicles involved in crashes each year was still over 1.1 million in 2000, displayed by collision severity and vehicle type. The table shows that automobiles, light trucks and vans are most frequently involved in collisions.

Number of Motor Vehicles Involved in Collisions by Vehicle Type - 2000

	Fatal	Non-Fatal Injury	Property Damage	Total Collisions
Automobiles	2,182	196,425	536,296	734,903

People at risk

Although the number of fatalities showed major decreases from 1991 to 2000 in most provinces, people are still at risk. From 1991 to 2000, fatalities at the national level decreased 21 percent. Quebec, British Columbia and the Atlantic Provinces except for Newfoundland and Labrador showed percentage decreases in fatalities greater than the national average, while other jurisdictions did not show as much improvement, and fatalities in Northwest Territories and Newfoundland and Labrador increased slightly over the period.

Fatalities in Motor Vehicle Traffic Collisions 1991-2000

	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Newfoundland	51	45	45	36	31	47	34	35	41	53

New Brunswick	118	131	138	79	113	94	105	96	110	89
Quebec	1,012	981	982	827	883	887	796	723	763	765
Ontario	1,102	1,090	1,135	999	999	929	900	854	868	849
Manitoba	119	118	134	119	128	93	119	121	113	111
Saskatchewan	170	143	153	151	157	133	165	148	186	151
Alberta	421	368	383	395	403	349	429	429	347	364
British Columbia	537	473	512	534	493	405	389	421	414	421
Yukon	10	15	8	10	13	6	4	12	16	9
Northwest Territories	4	11	4	3	5	15	14	5	11	7
Canada	3,690	3,501	3,615	3,263	3,351	3,091	3,064	2,949	2,985	2,926

Note: Fatalities in motor vehicle collisions includes all road users: drivers, passengers, motorcyclists, pedestrians, and cyclists, where death occurred within 30 days of the collision. The exception to this rule is Quebec (8 days).

Of the nine age groups other than 'Unknown age', fatalities over the 10-year period decreased more than the national average of 21 percent in four of the age groups, while four age groups showed smaller decreases. Fatalities in the 00-04 and 05-14 age groups resulting from motor vehicle traffic collisions decreased 50 percent and 40 percent, respectively, from 1991 to 2000. This could be the result of efforts by road safety

professionals to reduce these fatalities through education and publication of information about child restraint systems and the use of clinics to promote the proper use of child restraints. Other age groups showing large decreases in the number of fatalities over the period were the 20-24 and 25-34 age groups at 31 percent and 43 percent, respectively. All other age groups, except the 45-54 age group, showed decreases, but not as impressive. The increase in fatalities in the 45-54 age group reflects an increase in the population as the baby-boomers entered and continue to enter this age group.

Fatalities in Motor Vehicle Traffic Collisions by Age Group 1991-2000

Age Group	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000

Unknown	19	17	15	31	25	18	25	16	17	23
Total	3,690	3,501	3,615	3,263	3,351	3,091	3,064	2,949	2,985	2,926

Note: Fatalities in motor vehicle collisions includes all road users: drivers, passengers, motorcyclists, pedestrians, and cyclists, where death occurred within 30 days of the collision. The exception to this rule is Quebec (8 days).

Overall, injuries declined 9 percent with British Columbia, Manitoba, New Brunswick and Northwest Territories showing improvements greater than the national percentage change. Ontario and Newfoundland and Labrador showed smaller improvements, while Alberta, Prince Edward Island, Nova Scotia, Quebec, Yukon and Saskatchewan showed increases in the number of persons injured.

Injuries in Motor Vehicle Traffic Collisions 1991-2000

	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000

Despite the proven success of graduated licensing programs in many jurisdictions, young Canadians in the 15-19 and 20-24 age groups were consistently over-represented in fatalities and injuries. These teens and young adults accounted for about 14 percent of Canada's population, yet they accounted for about 26 percent of traffic deaths and injuries. The 65 + age group accounted for 18 percent of fatalities but represented only 12 percent of the population.

High-risk behaviour on our roads

Much of this carnage is preventable. The same high-risk behaviours continued to plague Canadian roads in 2000—impaired driving, non-use of seat belts and excessive speed.

Alcohol: unsafe at any speed

In 1987, 43 percent of Canadian drivers fatally injured and tested for alcohol were found to have a blood alcohol concentration (BAC) over the legal limit of .08 (80 mg%). During the 1990s, the percentage of fatally injured drivers in this category slowly decreased and accounted for 27 percent of those fatally injured drivers tested by 1999, but increased to 29 percent in 2000. Those who had been drinking (>0 mg%) declined from 53 percent to 35 percent between 1987 and 2000.

Percentage of Fatally Injured Drivers Tested and Found to Have Been Drinking

BAC: Blood Alcohol Concentration
 mg%: Weight of alcohol in the bloodstream stated as milligrams in 100 millilitres of blood.

While the percentage of fatally injured drivers tested and found to be over the legal blood alcohol limit has generally declined over the years, there are significant variations among age groups, which are presented in the following two charts. The first chart compares fatally injured drivers in age groups less than 36 years of age with the average across all age groups; the second compares age groups over 35 years of age with the average across all age groups.

Percentage of Fatally Injured Drivers Tested and Found to be Over the Legal Limit (BAC >80 mg%)

Age Group	1987	1988	1989	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000

Percentage of Fatally Injured Drivers Under 36 Years Found to be Over the Legal Limit Compared

Percentage of Fatally Injured Drivers Over 35 Years Old Tested and Found to be Over the Legal Limit Compared to All Ages

The alcohol-related casualty figures remain grim. Of almost 3000 road users killed in 2000, alcohol was a factor in approximately 1000 deaths. Many of the fatally injured drivers who had consumed alcohol were severely impaired.

9 out of 10 Canadians buckle up!

Seat belt use by Canadians is ranked among the highest in the world. Fifteen years ago, fewer than 3 out of 4 people buckled up. Since then, seat belt use has climbed steadily. More than 90 percent of all Canadians travelling in cars, vans and light trucks regularly use their seat belts. Among drivers, rates are even better, with some 92 percent buckling up in 2000. These new highs are encouraging, since in the late 1990s, rates seemed to plateau and even decrease slightly. However, seat belt wearing rates are not consistent across the Canadian provinces and territories.

Few other countries can measure up to Canada's record. In the United States, for example, rates of seat belt use are improving, but reached only 71 percent nationwide in 2000.

**Estimates of Seat Belt Use
Percentage of All Occupants Wearing Seat Belts in Light-Duty Vehicles****

	1992	1993	1994	1996	1997	1998	1999	2000	2001
Newfoundland	90.4	94.5	93.6	91.9	92.4	86.4	82.9	92.7	92.1

Canada	81.4	83.4	86.8	88.7	88.9	88.7	90.1	90.1	89.9

1992 is the first available year for this data. In 1992, the seat belt survey was expanded from driver only to occupants of the vehicle. This survey was not conducted in 1995.

** Light-duty vehicles include passenger cars, passenger vans and light trucks.

40 percent of Canadians killed had not buckled up

Most Canadians believe that seat belts will reduce the risk of death and injury; yet, almost 40 percent of motor vehicle occupants who died were not wearing a seat belt at the time of the collision. Among those seriously injured, 20 percent were not wearing their seat belts.

Drivers and Passengers at Risk

Seventy-six percent of road user fatalities are occupants of motor vehicles. Drivers accounted for 50 percent and passengers 26 percent. The next largest road user class, in terms of fatalities, was pedestrians at 13 percent. Even though motor vehicle occupants make up the largest percentage of road fatalities, they are not the most vulnerable road users. Those road users not protected by a passenger compartment are most vulnerable - pedestrians, bicyclists and motorcyclists.

Fatalities by Road User Class, 2000

Two-thirds of Canada’s road victims are male

Although 47 percent of Canada’s licensed drivers were female in 2000, 69 percent of fatalities were male. The proportion of males and females injured were split evenly at 50/50 corresponding very closely with the percentage of male and female drivers.

Young drivers are over-represented in fatal and injury-producing collisions

Compared to the overall population of licensed drivers in each age group, drivers 34 and under (15-19, 20-24 and 25-34) were over-represented in collisions resulting in injury and death. The table below demonstrates that younger drivers 24 and under, in particular, were involved in a disproportionately higher number of casualty collisions per 100,000 licensed drivers, than the rate for all age groups in total. Conversely, drivers 35 years of age and over were involved in a disproportionately lower number of casualty collisions than the rate for all age groups in total.

**Comparison of Drivers Involved in Fatal and Injury Collisions
Compared to licensed Drivers in 2000**

Age Group	Drivers Involved			Drivers Involved			Licensed Drivers	
	In Fatal Collisions	% Dist.	Rate per 100,000 Licensed Drivers	In Injury Collisions	% Dist.	Rate per 100,000 Licensed Drivers	Number	% Dist.
15-19	400	10.1	36.8	26,467	10.2	2,431.7	1,088,418	5.3
20-24	508	12.9	30.0	34,981	13.5	2,065.8	1,693,346	8.2
25-34	792	20.0	20.4	57,015	22.0	1,471.5	3,874,729	18.8
35-44	813	20.6	16.6	59,061	22.8	1,206.2	4,896,352	23.8
45-54	669	16.9	16.5	41,140	15.9	1,011.6	4,066,763	19.8
55-64	361	9.1	14.6	21,435	8.3	868.0	2,469,540	12.0
65 & over	409	10.3	16.4	18,988	7.3	760.5	2,496,849	12.1
Total	3,952	100.0	19.2	259,087	100.0	1,258.6	20,585,997	100.0

Almost all Canadians, regardless of age group, were safer on the roads

Almost all Canadians, regardless of age group, were safer on the roads, but two age groups showed increases in fatalities of 19 percent and 21 percent in the 45-54 and the unknown age groups, respectively, over the 10-year period. The 45-54 age group posted a strong increase in population as mentioned above.

All age groups under 35 years of age showed strong double-digit decreases in injuries. Injuries in all age groups over 34 years of age increased from 1991 to 2000 and were most notable in the 45-54, 65 and over, and unknown age groups showing increases of 28 percent, 12 percent and 52 percent, respectively.

Commercial vehicle collisions accounted for one in five deaths

In the National Safety Code for Motor Carriers, commercial vehicle is defined as a truck, tractor, or -trailer, or combination thereof exceeding a registered gross weight of 4 500 kilograms; or a bus designed, constructed and used for the transportation of passengers with a designated seating capacity of more than 10, including the driver, but excluding the operation for personal use.

The National Safety Code currently contains 15 standards addressing factors necessary for the safe operation of all commercial vehicles. The federal government has jurisdiction under the *Motor Vehicle Transport Act* to regulate truck and bus carriers that operate beyond the limits of a province. The Act creates a framework for shared responsibility between federal and provincial governments for the safe operation of motor carriers. The provinces and territories regulate the operations of carriers within their respective jurisdictions.

Over the period 1991 to 2000, injuries resulting from commercial vehicle collisions fell from 15,564 to 14,860; and fewer people died - a decrease from 662 to 587.

As impressive as these improvements are, however, commercial vehicle crashes are often deadly, and particularly dangerous to other users of the road. Although commercial vehicles, on average, accounted for approximately 8 to 9 percent of all vehicles involved in crashes, they accounted for an average of 19 percent of all road user fatalities or one in five road fatalities in Canada.

By far the majority of victims in commercial vehicle crashes were the occupants of the other vehicles involved. In 2000, for example, crashes involving commercial vehicles killed 587 persons; 447 of whom were occupants of the other vehicles involved. A report on *Heavy Truck Collisions 1994-1998* (TP 2436), determined that:

‘Drivers of automobiles, light trucks and vans were recorded as having a driver condition “other than apparently normal” 4.25 times more frequently than the drivers of heavy trucks in these (fatal) collisions.’

The report also noted that:

‘In fatal crashes, drivers of automobiles, light trucks and vans were recorded as having a driver action “other than driving properly” 2.74 times more frequently than the drivers of heavy trucks.’

Fatally-Injured Victims of Collisions Involving Commercial Vehicles

Year	Commercial Vehicle Occupants				Occupants of Other Vehicles	Pedestrians	All Victims
	Buses	Straight Trucks	Tractor-Trailers	Total Occupants			
1991	4	28	39	71	514	77	662
1992	5	28	42	75	458	54	587
1993	20	33	44	97	509	64	670
1994	10	40	34	84	496	59	639
1995	6	25	38	69	485	51	605
1996	0	25	33	58	434	64	556
1997	46	18	47	111	492	61	664
1998	4	28	40	72	444	62	578
1999	3	25	44	72	454	65	591
2000	10	30	52	92	447	48	587

The following chart compares the trends in fatalities in collisions involving commercial vehicles to total fatalities.

School bus travel is very safe

The number of school bus occupants fatally injured over the ten-year period was ten, two drivers and eight passengers. From 1995 to 2000, only three passengers of school buses were killed. It is very likely that some of the pedestrian fatalities in school bus collisions were actually occupants who had disembarked the bus and became pedestrians. The Traffic Accident Information Database does not contain this information.

Fatally-Injured Victims of Collisions Involving School Buses

Year	School Bus Occupants			Occupants of Other Vehicles	Pedestrians	All Victims
	Drivers	Passengers	All Occupants			
1991	1	2	3	21	8	32
1992	0	0	0	14	8	22
1993	0	0	0	10	2	12
1994	0	3	3	17	1	21
1995	0	0	0	11	2	13
1996	0	0	0	6	7	13
1997	0	0	0	9	2	11
1998	1	0	1	7	3	11
1999	0	1	1	7	5	13
2000	0	2	2	9	5	16

School buses are designed and manufactured to meet many safety standards to protect the occupants from serious injuries. Safety features include: high-backed, energy-absorbing seats; anchorage of the seats, brake systems, lighting, fuel system protection; emergency exits, tires, the strength of the body structure, stop arms; and special mirrors.

Vulnerable road users

While vehicle occupants account for over 75 percent of the deaths and injuries on Canada's roads, motorcyclists, bicyclists and pedestrians face considerable risks. Crashes involving these vulnerable road users claimed 567 lives in 2000.

Motorcyclists accounted for one in 18 fatalities

Motorcycle registrations in Canada have decreased from a high of 510,000 in 1983 to a low of 311,000 in 2000. In 2000, there was one motorcycle for every 57 motor vehicles registered. Nonetheless, motorcyclists still accounted for almost six percent (173) of Canada's road user fatalities in 2000.

Motorcyclist fatalities reached their lowest level in 1997, then increased again over the next three years to 173. Fatal motorcycle crashes claimed 62 percent fewer lives in 2000 than in 1983 when fatalities were at their highest (450). Motorcyclist fatalities were down significantly in 2000 compared to 1991 for age groups less than 35 and injuries were down for age groups less than 45. The age groups of 35 - 44 and above for fatalities and

45-54 and above for injuries showed increases. The only exception to this was for fatalities in the 55-64 age group, which dropped from 6 to 5 fatalities.

Motorcyclist Fatalities by Age Group, 1991-2000

Motorcyclist Injuries by Age Group, 1991-2000

Bicycle deaths cut in half - even for high-risk young boys

The number of Canadians killed on bicycles continued an overall downward trend throughout the 1990s. By 2000, fatalities had decreased 61 percent from the 1991 level.

Of the 40 bicyclists killed in 2000, 23 percent were in the 35-44 age group, 18 percent were between 05-14 years of age, 12.5 percent were in each of the 15-19, 25-34, and 65+ age groups and 10 percent were of unknown age. The distribution of injuries was 28 percent unknown, 21 percent in the 05-14 age group, 10 to 11 percent in each of the 15-19, 25-34, and 35-44 age groups, 8 percent in the 20-24 age group and 11 percent in age groups greater than 44 years.

Despite helmet laws and education programs, cyclists between 5 and 14 were still the most likely to be injured, accounting for 21 percent of injuries. The majority of these young people - 6 of the 7 fatalities and 3 of 4 injuries were boys.

Bicyclist Fatalities by Age Group, 1991-2000

Bicyclist Injuries by Age Group, 1991-2000

Older pedestrians accounted for one third of all pedestrian fatalities

Across Canada, pedestrian deaths were down by 31 percent, injuries by 10 percent. In 2000, 367 pedestrians were killed and 13,727 were injured. That's 1 pedestrian killed and 38 injured each day, on average. Almost 70 percent were killed in urban areas, almost two-thirds at intersections.

Canada's seniors were particularly vulnerable. People 65 and over accounted for a third of pedestrian fatalities in 2000, even though they represented only 12.5 percent of the population. Pedestrian fatalities among males in the 65+ age group decreased by 4 percent over the 10-year period, while pedestrian fatalities among women of the same age group decreased 40 percent.

**Pedestrians Fatalities per 100,000 Population
by Age Group, 1991-2000**

Age Group	Male		Female		Total	
	1991	2000	1991	2000	1991	2000
00-04	1.3	0.4	0.5	0.1	0.9	0.3
05-09	2.1	1.2	1.8	0.2	2.0	0.7
