# REVIEW NOTICE

This report has been reviewed by officials of the Mining and Minerals Section, Environment Canada, and approved for publication. Approval does not necessarily signify that the contents reflect the views and policies of Environment Canada. Mention of trade names or commercial products does not constitute recommendation or endorsement for use.

The data used in this report were provided to Environment Canada regional staff under section 22 of the *Metal Mining Effluent Regulations* (MMER), which requires mines to submit annual reports to Environment Canada. They were compiled by staff of the Mining and Minerals Section in Environment Canada headquarters and are presented as provided by the mines from their submitted annual reports. Occasionally, quarterly reports were used by Environment Canada regional staff to complete missing information that was not properly reported by the owners or operators of some mines.

This report has been compiled to inform the regulated community, other stakeholders, and the interested public on the performance of mines subject to the MMER in 2003. The material has been prepared for informational purposes only. For all purposes of interpreting and applying the law, users should consult the Regulations, as registered by the Clerk of the Privy Council and published in Part II of the *Canada Gazette*.

# ABSTRACT

This report summarizes the performance of Canadian metal mines with respect to selected standards prescribed by the *Metal Mining Effluent Regulations* (MMER), which were registered on June 6, 2002, and came fully into force on December 6, 2002.

This is the first report on performance with respect to the MMER since the *Metal Mining Liquid Effluent Regulations* were repealed and replaced by the new Regulations on December 6, 2002. Environment Canada expects to publish a report on mine performance with respect to the MMER every year.

More information on the MMER and related guidance documents is available on Environment Canada's Green Lane at [www.ec.gc.ca/nopp/docs/regulations/mmer/en/index.cfm](http://www.ec.gc.ca/nopp/docs/regulations/mmer/en/index.cfm)

# SUMMARY

This report summarizes the performance of Canadian metal mines with respect to selected standards prescribed by the *Metal Mining Effluent Regulations* (MMER), which came fully into force on December 6, 2002. This is the first report on performance with respect to the MMER since the *Metal Mining Liquid Effluent Regulations* were repealed and replaced by the new Regulations.

The MMER require at least weekly sampling of effluent and the submission of quarterly and annual reports of results within specified time limits. The data used in this report were provided to Environment Canada under section 22 of the MMER, which requires mines to submit annual reports to Environment Canada. The format for these reports is specified in Schedule 6 of the MMER. The reports include:

- a) monthly mean concentrations for metals and total suspended solids (TSS);
- b) monthly pH range; and
- c) summary results of acute lethality tests and *Daphnia magna* monitoring tests.

Data were provided to Environment Canada regional staff and compiled by staff of the Mining and Minerals Section in Environment Canada headquarters. Data are generally presented as provided by the mines from their submitted annual reports. Occasionally, quarterly reports were used by Environment Canada regional staff to correct or complete missing information that was not properly reported by the owner or operator of a mine. For these facilities, a comment has been added in the appropriate summary tables presented in Appendix E to identify which information was not submitted as part of the annual report.

In 2003, 73 mining facilities operating in Canada were subject to the MMER. No metal mines were subject to the Regulations in Yukon, Alberta, Nova Scotia, or Prince Edward Island. The MMER define a mine as a stand-alone mining operation, a stand-alone mill, or a combination of both. In some cases, it was observed that several mines were combining their effluents prior to treatment and discharge. Consequently, the number of facilities subject to the MMER does not represent the total number of producing metal mines in Canada.

Pursuant to sections 9 and 10 of the Regulations, 119 final discharge points (FDPs) were identified as being subject to the Regulations. Reported data indicate that 60 FDPs had continuous effluent discharge, 55 FDPs had intermittent discharge, and 4 FDPs did not have any discharge in 2003.

Transitional Authorizations (TAs) were granted to 18 facilities. The authorizations applied to 21 FDPs for which new limits were set for TSS or pH or allowing the deposit of acutely lethal effluents.

Overall, the metal mining sector achieved over 99% compliance with the prescribed limits for arsenic, copper, lead, nickel, zinc, Radium 226, and pH and 100% compliance for cyanide. Only a few sporadic exceedances were reported for arsenic, copper, lead, nickel, zinc, and Radium 226. Some mines were challenged to routinely meet TSS limits, and the overall compliance rate was 92.1%.

With respect to rainbow trout acute lethality and *Daphnia magna* monitoring tests, the metal mining sector achieved a non-acutely lethal effluent compliance rate of 95.0% for rainbow trout and 94.2% for *Daphnia magna*.

In total, 106 exceedances of the prescribed limits for metals and pH were reported. TSS exceedances account for 75.5% of all exceedances, metal exceedances for 17%, and pH exceedances for 7.5%. Forty-nine facilities complied with the maximum authorized monthly mean concentrations and pH. Twenty-four facilities reported at least one exceedance in 2003, and six facilities exceeded their TA limits once.

Of the total number of exceedances that were reported in 2003, 41% occurred in facilities located in Newfoundland and Labrador, 14% in facilities in Quebec, 8% in Ontario, and 12% in each of Manitoba, British Columbia, and the Northwest Territories. Exceedances reported by facilities located in Saskatchewan accounted for 1%. No exceedances were reported by mines located in New Brunswick or Nunavut. The iron ore subsector accounted for 42.5% of all exceedances, the base metals subsector for 45.3%, and the precious metals subsector for 12.2%. No exceedances were reported from the uranium subsector.

In 2003, 48 effluents from 12 facilities were reported to be acutely lethal to rainbow trout. Of those, 39.6% were from facilities located in Newfoundland and Labrador, 31.25%

from facilities in Quebec, and less than 10% from the other jurisdictions. None of the effluents tested in Nunavut and the Northwest Territories were acutely lethal to rainbow trout. On a sectoral basis, 52.1% of acutely lethal effluents were from the base metals subsector, 39.6% from the iron ore subsector, 6.2% from the precious metals subsector, and 2.1% from the uranium subsector.

In 2003, 56 effluents from 17 facilities resulted in a *Daphnia magna* mortality rate greater than 50%. Quebec had the highest percentage (37.5%) of tests in which *Daphnia magna* mortality was greater than 50%, followed by British Columbia (23.2%), Newfoundland and Labrador (12.5%), Manitoba (10.7%), New Brunswick (7.1%), and all other jurisdictions (about 5%); the exception was the Northwest Territories, where *Daphnia magna* mortality was in all cases less than 50%. On a sectoral basis, 76.8% of effluents leading to greater than 50% *Daphnia magna* mortality were from the base metals subsector, 12.5% from the iron ore subsector, 7.1% from the precious metals subsector, and 3.6% from the uranium subsector.

# SOMMAIRE

Ce rapport donne un aperçu sommaire de la performance des mines de métaux canadiennes en ce qui a trait à certaines normes prescrites par le *Règlement sur les effluents des mines de métaux* (REMM), enregistré le 6 juin 2002 et entré en vigueur le 6 décembre de la même année. Il s'agit du premier rapport de performance présenté en vertu du REMM, depuis que le *Règlement sur les effluents liquides des mines de métaux* (RELMM) a été abrogé et remplacé par le nouveau règlement.

Le REMM prévoit l'échantillonnage de l'effluent au moins une fois par semaine et la présentation de rapports de résultats trimestriels et annuels selon un échéancier précis. Les données utilisées dans le présent rapport ont été transmises à Environnement Canada en vertu de l'article 22 du REMM, qui exige la présentation de rapports annuels au Ministère. Le format de ces rapports est présenté à l'annexe 6 du REMM. Les rapports doivent comprendre les renseignements suivants :

- les concentrations moyennes mensuelles pour les métaux et le total des solides en suspension;
- la plage mensuelle du pH;
- les résultats sommaires des essais de détermination de la létalité aiguë et des essais de suivi avec bioessais sur *Daphnia magna*.

Les données ont été fournies à Environnement Canada par le personnel régional et compilées par le personnel de la Section des mines et minéraux, à l'administration centrale d'Environnement Canada. Ces données sont généralement présentées telles que fournies par les propriétaires ou exploitants de mines dans leurs rapports annuels. À l'occasion, le personnel régional d'Environnement Canada a dû recourir aux rapports trimestriels pour compléter l'information manquante qui n'avait pas été convenablement fournie par le propriétaire ou l'exploitant d'une mine. Dans ces cas-là, on a ajouté, dans les tableaux récapitulatifs pertinents de l'annexe E, un commentaire indiquant les renseignements non mentionnés dans le rapport annuel.

En 2003, 73 installations minières exploitées au Canada étaient assujetties au REMM. Aucune mine de métaux n'était réglementée au Yukon, en Alberta, en Nouvelle-Écosse ou à l'Île-du-Prince-Édouard. Le REMM définit une mine comme une exploitation minière autonome, une installation autonome de préparation du minerai ou une

combinaison des deux. Comme dans plusieurs cas on a observé que plusieurs mines combinaient leurs effluents avant de les traiter et de les rejeter, le nombre d'installations visées par le REMM ne représente donc pas le nombre total de mines de métaux en exploitation au Canada.

Un total de 119 points de rejet final (PRF) ont été recensés aux termes des articles 9 et 10 du règlement. D'après les données présentées, 60 points de rejet final ont déversé des effluents en continu et 55 de façon intermittente en 2003, et 4 n'en ont déversé aucun.

Des autorisations transitoires ont été accordées à 18 installations. Ces autorisations s'appliquaient à 21 points de rejet final, pour lesquels elles fixaient de nouvelles limites pour le total des solides en suspension et le pH, et permettaient le rejet d'effluents à létalité aiguë.

Dans l'ensemble, le secteur des mines de métaux s'est conformé à plus de 99 % aux limites prescrites pour l'arsenic, le cuivre, le plomb, le nickel, le zinc, le Radium 226 et le pH, et à 100 % pour les cyanures. Seuls quelques dépassements sporadiques ont été signalés pour l'arsenic, le cuivre, le plomb, le nickel, le zinc et le Radium 226. Certaines mines semblent avoir du mal à respecter systématiquement les limites fixées pour le total des solides en suspension, dont le taux global de conformité était de 92,1 %.

En ce qui a trait aux essais de détermination de la létalité aiguë chez la truite arc-en-ciel et aux essais de suivi avec bioessais sur *Daphnia magna*, le secteur des mines de métaux a obtenu un taux de conformité de 95 % pour les effluents à létalité non aiguë pour la truite arc-en-ciel, et de 94,2 % pour *Daphnia magna*.

Au total, 106 dépassements des limites prescrites ont été signalés pour les métaux et le pH. Les dépassements des limites fixées pour le TSS représentent 75,5 % de tous les dépassements, ceux des limites fixées pour les métaux, 17 %, et ceux des limites pour le pH, 7,5 %. Quarante-neuf installations ont respecté les concentrations moyennes mensuelles maximales permises et les limites fixées pour la plage du pH. Vingt-quatre ont déclaré au moins un dépassement en 2003, et 6 ont dépassé les limites fixées par les autorisations transitoires (AT) une seule fois.

Sur l'ensemble des dépassements signalés en 2003, 41 % sont survenus dans des installations situées à

Terre-Neuve-et-Labrador, 14 % au Québec, 8 % en Ontario, et environ 12 % chacun au Manitoba, en Colombie-Britannique et dans les Territoires du Nord-Ouest. Les dépassements signalés par les installations de la Saskatchewan représentaient 1 % du total. Aucun dépassement n'a été signalé dans les mines du Nouveau-Brunswick et du Nunavut. Le sous-secteur du minerai de fer était responsable de 42,5 % de tous les dépassements, celui des métaux communs, de 45,3 %, et celui des métaux précieux, de 12,2 %. Aucun dépassement n'a été signalé pour le sous-secteur de l'uranium.

En 2003, 48 effluents à létalité aiguë pour la truite arc-en-ciel ont été relevés dans 12 installations. De ces effluents, 39,6 % provenaient d'installations situées à Terre-Neuve-et-Labrador, 31,25 % d'installations situées au Québec, et moins de 10 % d'installations dans d'autres provinces ou territoires. Aucun des effluents testés au Nunavut et dans les Territoires du Nord-Ouest n'a fait état d'une létalité aiguë pour la truite arc-en-ciel. Par secteur, 52,1 % des effluents à létalité aiguë provenaient du sous-secteur des métaux communs, 39,6 % de celui du minerai de fer, 6,2 % de celui des métaux précieux, et 2,1 % de celui de l'uranium.

En 2003, 56 essais ont mis en évidence un taux de mortalité supérieur à 50 % pour *Daphnia magna* dans les effluents de 17 installations. C'est le Québec qui vient en tête à cet égard (37,5 %), suivi par la Colombie-Britannique (23,2 %), Terre-Neuve-et-Labrador (12,5 %), le Manitoba (10,7 %), le Nouveau-Brunswick (7,1 %) et les autres provinces (à raison d'environ 5 % chacune); dans les Territoires du Nord-Ouest, le taux de mortalité pour *Daphnia magna* a été dans tous les cas inférieur à 50 %. Par secteur, 76,8 % des effluents létaux provenaient du sous-secteur des métaux communs, 12,5 % de celui du minerai de fer, 7,1 % de celui des métaux précieux et 3,6 % de celui de l'uranium.

# 1.0 INTRODUCTION

This report summarizes the performance of Canadian metal mines with respect to some key aspects of the *Metal Mining Effluent Regulations* (MMER) under the *Fisheries Act* for the calendar year 2003. This is the first report on performance with respect to the MMER since the Regulations came fully into force on December 6, 2002.

The *Fisheries Act* provides the primary legislative authority for federal water pollution control programs. Subsection 36(3) of the *Fisheries Act* prohibits the deposit of deleterious substances into waters frequented by fish, unless authorized by regulations.

These regulations replace the *Metal Mining Liquid Effluent Regulations* (MMLER), which had been in place since 1977, and repeal the *Alice Arm Tailings Deposit Regulations*, which were promulgated in 1979. The MMER apply to all operating metal mines in Canada, whereas the MMLER applied only to those that began operation after 1977 and those that did not use cyanide in the milling process.

The MMER also introduced:

- more comprehensive and stringent effluent quality standards based on best available technologies economically achievable;

- a new requirement for mines to produce effluent that is non-acutely lethal to rainbow trout; and
- a requirement for all mines to conduct a comprehensive environmental effects monitoring (EEM) program, including submission of various reports on their effluent characterization, water quality monitoring, sublethal toxicity testing, biological monitoring, study designs, and interpretive reports.

Benefits include increased treatment of effluent, resulting in a decrease in the discharge of pollutants; increased monitoring and reporting; enhanced protection of aquatic environments, including a reduction in toxicity; and world leadership in mining environmental practices and technologies.

An overview of the MMER and their application to Canadian metal mines is presented in Section 2.

The status of individual mines in meeting the effluent quality standards of the Regulations in 2003 is reviewed in Sections 3 and 4.

# 2.0 METAL MINING EFFLUENT REGULATIONS (MMER)

The MMER were registered on June 6, 2002, under subsections 34(2), 36(5), and 38(9) of the *Fisheries Act*. The MMER replaced the MMLER and the associated Metal Mining Liquid Effluent Guidelines, which came into force in February 1977. The MMER also repealed the *Alice Arm Tailings Deposit Regulations*, which were promulgated in 1979.

The Regulations are the result of extensive and comprehensive consultation processes spanning a period of approximately six years. These consultations included the “Assessment of the Aquatic Effects of Mining in Canada” (AQUAMIN) process and a number of subsequent consultations that involved representatives of other federal departments, provincial governments, industry, environmental non-government organizations, Aboriginal groups, and scientific and engineering communities. The Regulations represent an appropriate balance of the divergent views and preferences of stakeholders, consistent with appropriate scientific, technological, environmental, economic, social, and legal considerations.

The MMER prescribe authorized concentration limits for deleterious substances in mine effluents that discharge to waters frequented by fish. The regulated parameters are arsenic, copper, cyanide, lead, nickel, zinc, total suspended solids (TSS), Radium 226, and pH.

## 2.1 Application

The MMER apply to all Canadian metal mines (except placer mines) that exceeded an effluent flow rate of 50 m<sup>3</sup> per day at any time after the Regulations were registered. Mines are defined as facilities where ore is mined or milled and include mines under development, new mines, and reopened mines.

The MMER apply to effluent from all final discharge points (FDPs) at a mine site. An FDP is defined in the Regulations as a point beyond which the mine no longer exercises control over the quality of the effluent.

## 2.2 Prescribed Parameters, pH, and Acute Lethality

Schedule 4 of the MMER specifies the deleterious substances and the maximum prescribed limits under which these substances may be discharged in mine effluent. The

maximum allowable concentrations of these substances are presented in Table 1.

Included in the list of deleterious substances is cyanide, a chemical commonly used in the processing of ores containing gold and silver and sometimes used in the processing of nickel, copper, lead, and zinc. Since cyanide is an additive, monitoring of this parameter is required only at those sites where it is used as a process chemical. The MMER require Radium 226 monitoring at all metal mines.

The MMER also specify maximum and minimum pH values (Table 1) for effluent and include a requirement that effluent be non-acutely lethal to rainbow trout. In addition, a *Daphnia magna* monitoring test must be conducted at the same time that an acute lethality test is conducted on rainbow trout.

The MMER limits are based on a comprehensive review and assessment of national and international mining effluent standards, pollution prevention practices, control technologies of relevance to the mining sector, and the performance of the Canadian mining sector in terms of effluent quality. The limits reflect the effluent quality that was achieved by the best-performing (upper 50th percentile) Canadian metal mines at the time the review was completed (SENES, 1999) and thus are based on the availability of demonstrated technology.

## 2.3 Effluent Monitoring

### 2.3.1 Prescribed Deleterious Substances and pH

Effluent monitoring requirements are specified in sections 12 through 19 of the MMER. Sampling and analysis requirements specify that the deleterious substances set out in column 1 of Schedule 4 and pH must be sampled and analyzed not less than once a week. However, the MMER also specify conditions under which the frequency of monitoring may be reduced to quarterly for arsenic, copper, cyanide, lead, nickel, zinc, and Radium 226. There is no such relief for TSS and pH monitoring, both of which must always be done on a weekly basis, along with effluent flow measurements. In addition, the owner or operator is not required to collect samples for the purpose of recording the concentrations of cyanide if that substance is not used as a process reagent within the operation area. In the event that a mine that is on a reduced or quarterly monitoring scheme

cannot meet the requirements described in the MMER, the owner or operator is required to resume monitoring on a weekly basis until such time as the mine requalifies for reduced frequency of monitoring.

The MMER do not specify analytical procedures for analysis of samples, but do specify minimum analytical detection limits, as well as accuracy and precision for all analyses used. The *Guidance Document for the Sampling and Analysis of Metal Mining Effluents* (Environment Canada, 2001a) provides references to suitable analytical methods and discusses sampling and chemical analysis considerations and procedures for use with metal mining effluents.

### 2.3.2 Acute Lethality Testing

As indicated in Table 1, the MMER include a requirement that effluent be non-acutely lethal to rainbow trout. Acute lethality testing must be done once a month, in accordance with the procedures set out in Environment Canada's Reference Method EPS 1/RM/13 (Environment Canada, 2000a).

In the event that a sample is determined to be acutely lethal to rainbow trout, the owner or operator of the mine is required to increase the frequency of acute lethality testing at all FDPs to twice a month. The mine owner or operator is also required to notify an inspector at Environment Canada

regarding the failure of the test. Monthly acute lethality testing may resume if, in three consecutive tests, the effluent is determined not to be acutely lethal.

The frequency of acute lethality testing may be reduced to quarterly if effluent is determined not to be acutely lethal over a period of 12 consecutive months. If effluent is subsequently determined to be acutely lethal, the mine must then increase the sampling frequency to twice a month. If results permit, the owner or operator must then follow the procedure outlined in the MMER to restore the monthly sampling schedule and then the quarterly sampling frequency.

Each time that an acute lethality test is conducted on rainbow trout, the owner or operator of the mine is also required to conduct a lethality test on *Daphnia magna*, a small aquatic organism known as a water flea. The results of these tests must be recorded, but there is no requirement in the MMER that effluent be non-acutely lethal to *Daphnia magna*. This monitoring test must be done in accordance with Environment Canada's Reference Method EPS 1/RM/14 (Environment Canada, 2000b).

When samples are collected for acute lethality testing, samples are also collected to conduct effluent characterization, if required. In the event that a sample is determined to be acutely lethal to rainbow trout, then effluent characterization must be conducted. The

**Table 1: Authorized Levels Prescribed in the MMER<sup>(1)</sup>**

Deleterious Substance	Units	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Composite Sample	Maximum Authorized Concentration in a Grab Sample
Arsenic (As)	mg/L	0.5	0.75	1.0
Copper (Cu)	mg/L	0.3	0.45	0.6
Cyanide (CN)	mg/L	1.0	1.5	2.0
Lead (Pb)	mg/L	0.2	0.3	0.4
Nickel (Ni)	mg/L	0.5	0.75	1.0
Zinc (Zn)	mg/L	0.5	0.75	1.0
Radium 226	Bq/L	0.37	0.74	1.11
Total suspended solids (TSS)	mg/L	15	22.5	30
Percentage of non-acutely lethal effluent <sup>(2)</sup>			100%	
pH range			6.0 – 9.5	

Notes:

(1) All concentrations are total values.

(2) For the purposes of the MMER, non-acutely lethal means survival of at least 50% of rainbow trout subjected to 100% concentration effluent for a period of 96 hours.

effluent characterization involves analyzing the samples for aluminum, cadmium, iron, mercury, molybdenum, ammonia, and nitrate. The main objective of these tests is to help determine the cause of acute lethality.

### 2.3.3 Flow and Loading

The owner or operator of a mine must measure the effluent flow rate at the same time that effluent samples are collected for analysis for deleterious substances. Based on these weekly measurements, the total monthly effluent volume can be calculated for each FDP, which is a reporting requirement.

Under the MMER, a mine owner or operator must use calibrated flow monitoring equipment that is accurate to within  $\pm 15\%$  of the measured flow. The MMER also require that the equipment be calibrated annually. The *Guidance Document for Flow Measurement of Metal Mining Effluents* (Environment Canada, 2001b) provides references for selection, design, installation, maintenance, calibration, and reporting protocols of flow measurement systems. The document stresses the use of performance-based methods and how such methods should be applied to the mining industry.

Flow measurement data and data from the analysis of samples for prescribed deleterious substances are used to calculate the daily mass loading of each deleterious substance set out in column 1 of Schedule 4 of the MMER. These calculations are then used to determine the monthly mass loading for each deleterious substance. If the owner or operator of a mine has reduced the frequency of testing to not less than once in each calendar quarter, the owner or operator must calculate the mass loading for that quarter in accordance with subsection 20(4) of the MMER.

### 2.3.4 Reporting

The owner or operator of a mine is required to submit four quarterly and one annual monitoring report to the appropriate authorization officer each year. The MMER require that this information be submitted in a written form and in an electronic form, where such a system is provided by Environment Canada. The Regulatory Information Submission System (RISS) is the electronic system being developed by Environment Canada to address this need. For the purposes of MMER data reporting, the system should be implemented nationally in 2005. The system will make the submission of reports easier and allow for more efficient management of the submitted data.

Under the MMER, mine owners or operators are required to submit detailed quarterly reports. These reports must be submitted no later than 45 days after the end of the calendar quarter and must include:

- results of all analyses of pH and deleterious substances and the monthly mean concentrations of deleterious substances;
- whether a composite or grab sample collection method was used;
- results of all acute lethality tests conducted on rainbow trout and all *Daphnia magna* monitoring tests;
- effluent flow data, including the total volume of effluent discharged during each month of the reporting quarter;
- mass loadings of deleterious substances; and
- results of any effluent characterization test conducted in that quarter.

Annual reports must be submitted no later than March 31 in each year, for data collected in the previous calendar year. The annual reports provide less detail than the quarterly reports, but do require the reporting of:

- the monthly mean concentrations of deleterious substances;
- the monthly pH range;
- the monthly volume of effluent discharged; and
- the results of all acute lethality tests conducted on rainbow trout and all *Daphnia magna* monitoring tests.

Mines are also required to provide information if the effluent was non-compliant with the acute lethality requirements or the authorized levels of deleterious substances or pH prescribed in the MMER. The requested information includes the causes of non-compliance as well as remedial measures planned or implemented in response to exceedances or failure of acute lethality tests.

## 2.4 Transitional Authorizations (TAs)

During the development of the MMER, it was recognized that some mines would have difficulty complying with all provisions of the MMER when the Regulations came into force. The Transitional Authorization (TA) concept is based on a consensus recommendation of the multistakeholder AQUAMIN report, which states: "It is recommended that there be a transition period to ensure that any mines that are not under regulation or not in compliance have a reasonable time to improve their control systems." Therefore, the MMER allow for the opportunity for some mines, under specified conditions, to obtain a TA that provides additional time to come into compliance with the new effluent

standards. Mines were able to apply for TAs where it could be demonstrated that a mine would be unable to comply with prescribed limits in those cases where:

- the mine was not subject to the MMLER; or
- the mine was unable to eliminate deposits of acutely lethal effluent; or
- the mine was unable to meet new prescribed limits (i.e., for cyanide and TSS); and
- reasonable measures were being taken to comply, e.g., through the preparation of remedial plans.

Where provincial or territorial requirements are the same as or more stringent than the federal regulations, the more stringent requirements would prevail, and such mines would not be eligible for a TA.

Mines were required to apply for TAs by September 6, 2002, and these TAs expired on December 6, 2004. TAs granted are summarized in Table 2, and more detailed information is provided in Appendix A.

**Table 2: Summary of Transitional Authorizations Granted Pursuant to Section 35 of the MMER**

Parameter	Number of Facilities	Number of FDPs
TSS only	9	12
TSS and acute lethality	2	2
pH only	2	2
pH and acute lethality	2	2
Acute lethality only	3	3
<b>Total</b>	<b>18</b>	<b>21</b>

## 2.5 Recognized Closed Mines

When a mine ceases commercial operation, the owner or operator may notify Environment Canada of the intent to become a recognized closed mine. A mine becomes a recognized closed mine three years from the date of notification, provided that the mine's production remains at less than 25% of the design rated capacity. During this three-year period, all regulatory requirements of the MMER remain in place, and the mine must continue all specified monitoring and reporting to Environment Canada.

At the end of the three-year period, the mine becomes a recognized closed mine and is subject to section 36(3) of the *Fisheries Act*, which prohibits any discharge of any deleterious substance into fish-bearing waters. However, the owner or operator must continue to provide information to Environment Canada regarding any changes in site ownership.

These provisions are voluntary, and, at the end of commercial operations, an owner or operator may choose not to become a recognized closed mine and to remain subject to the full requirements of the MMER.

## 2.6 Environmental Effects Monitoring (EEM)

The objective of the metal mining EEM program is to evaluate the effects of mining effluent on the aquatic environment, specifically fish, fish habitat, and the use of fisheries resources. The program will help evaluate the effectiveness of current and future pollution prevention and control technologies, practices, and programs within the mining sector and will help evaluate the need for more enhanced protection of fish, fish habitat, and fisheries resources on a site-specific basis. Each mine owner or operator is required to develop, conduct, and report the findings of a site-specific EEM program that monitors key components of the aquatic ecosystem. All mines are required to:

- submit study designs detailing each field monitoring study;
- conduct a field monitoring program as described by the study design;
- submit interpretive reports after completion of each field study; and
- conduct ongoing effluent characterization, sublethal toxicity testing, and water quality monitoring.

The biological monitoring program encompasses a fish population survey and a benthic invertebrate community survey. The fish survey is designed to assess effects on fish growth, reproduction, condition, and survival. Required measurements include sex, age, length, weight, liver size, gonad size, fecundity, egg size, and external condition. The benthic invertebrate community survey is used in EEM to provide an indication of the health of fish habitat. Measures of changes in community structure and composition are used to indicate impairment that results from contaminant or nutrient stressors.

The frequency and nature of EEM monitoring will vary at each site, depending upon the results of previous monitoring studies. Where an effect on fish or benthic invertebrates is found and confirmed, mines will be required to conduct focused monitoring to determine the extent and magnitude of the effect. As well, investigations will be undertaken to determine the cause of the effect. Where EEM studies confirm that there are no effects, the mine will be required to conduct periodic monitoring with a reduced frequency in comparison with focused monitoring.

Reporting requirements for the EEM program are detailed in Schedule 5 of the MMER. Mines submit annual reports by March 31 on their effluent characterization, water quality monitoring, and sublethal toxicity testing. In fulfilment of the biological monitoring reporting requirements, study designs were submitted by December 6, 2003, and first interpretive reports were submitted by June 6, 2005. Mines that had historical data were permitted to submit a report on historical data by December 6, 2003, and were given an additional year to submit their first study design, by December 6, 2004. The first interpretive reports on biological monitoring for mines that submitted reports on historical data are due by June 6, 2006.

## 2.7 Compliance and Enforcement

These Regulations are enforced by Environment Canada in accordance with the Compliance and Enforcement Policy for the Habitat Protection and Pollution Prevention Provisions of the *Fisheries Act*. Under this policy, the following general principles apply:

- Compliance with the habitat protection and pollution prevention provisions and their accompanying regulations is mandatory.
- Compliance will be encouraged through communication with parties affected by the habitat protection and pollution prevention provisions of the *Fisheries Act*.
- Enforcement personnel will administer the provisions and regulations in a manner that is fair, predictable, and consistent. Rules, sanctions, and processes securely founded in law will be used.

- Enforcement personnel will administer the provisions and accompanying regulations with an emphasis on preventing harm to fish, fish habitat, or human use of fish caused by physical alteration or pollution of waters frequented by fish. Priority for action to deal with suspected violations will be guided by:
  - the degree of harm to fish, fish habitat, or human use of fish caused by physical alteration of habitat or pollution of water frequented by fish, or the risk of that harm; and/or
  - whether or not the alleged offence is a repeat occurrence.
- Enforcement personnel will take action consistent with this policy.
- The public will be encouraged to report suspected violations of the Habitat Protection and Pollution Prevention Provisions of the *Fisheries Act*.

Compliance monitoring is conducted to verify that metal mining activities are carried out in accordance with the Regulations. Compliance monitoring may also measure potentially harmful impacts on the environment associated with the suspected violations.

Means to accomplish compliance monitoring include site and administrative inspections, validation of mandatory reporting, sampling by enforcement officials, and monitoring of releases.

In verifying compliance with these Regulations, inspectors abide by the Compliance and Enforcement Policy, which sets out a range of possible responses to offences, including warnings, inspector's directions, ministerial orders, injunctions, prosecution, and civil suits by the Crown for the recovery of costs. If an inspector confirms that an infraction has been committed, the inspector will select the appropriate response based on the following criteria: nature of the offence, effectiveness in achieving the desired result with the offender, and consistency.

## 3.0 MINES SUBJECT TO THE MMER IN 2003

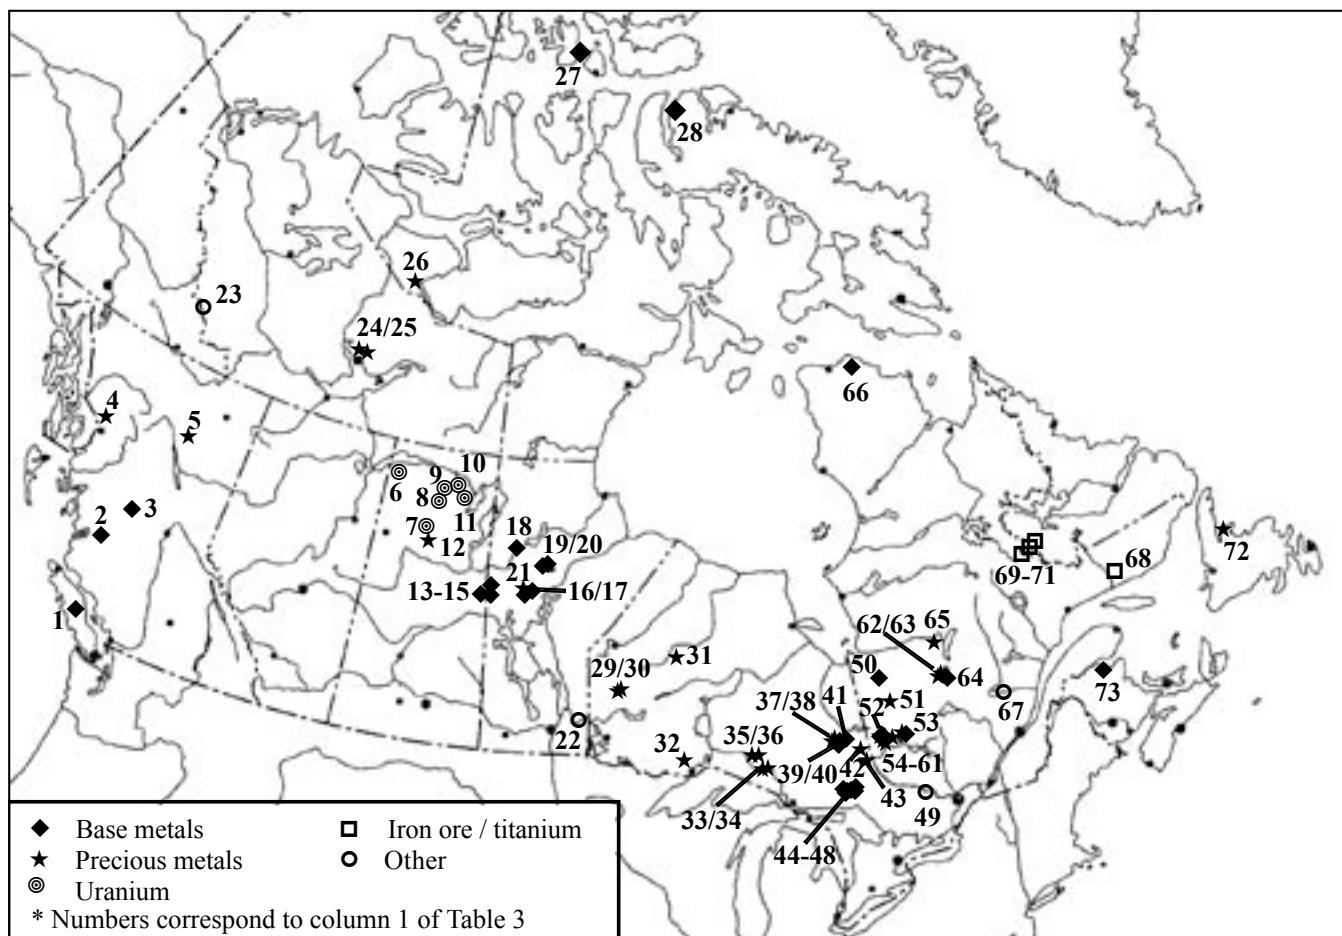

In 2003, 73 facilities in Nunavut, the Northwest Territories, and all provinces except Yukon, Alberta, Nova Scotia, and Prince Edward Island were subject to the MMER.

These facilities are listed in Table 3, and their locations are illustrated in Figure 1. Additional information on these facilities is provided in Appendix B. For the purposes of the MMER, a facility is defined as a stand-alone mine, a stand-alone mill, or a combination of both. In some cases, it was observed that several mines use the same tailings facility to treat and discharge their mine/mill effluents. Consequently, the number of facilities subject to the MMER does not represent the number of producing metal mines in Canada.

Pursuant to sections 9 and 10 of the Regulations, 119 FDPs were identified. Of those, 60 FDPs had continuous effluent discharge, 55 had intermittent effluent discharge (i.e., did not discharge 12 months a year), and 4 did not have any effluent discharge in 2003. The number of FDPs per facility ranged from one to eight, as illustrated in Table 4. Distributions of facilities and FDPs per jurisdiction are shown in Table 5.

**Table 3: Mining Facilities Subject to the MMER in 2003**

Facility	Jurisdiction	Facility	Jurisdiction
1 Myra Falls Operations	British Columbia	38 Holt McDermott	Ontario
2 Endako	British Columbia	39 Kidd Mine	Ontario

# 4.0 PERFORMANCE DATA

## 4.1 Data Collection

The data used in this report were provided under section 22 of the MMER, which requires mines to submit annual reports to Environment Canada. The format for these reports is specified in Schedule 6 of the MMER. The reports include:

- monthly mean concentrations for metals;
- monthly pH range;
- monthly volume of effluent discharged; and
- results of acute lethality tests and *Daphnia magna* monitoring tests.

Data submitted by mines were validated by Environment Canada regional staff and then provided to staff at the Mining and Minerals Section at Environment Canada headquarters for compilation. Data are presented as provided by the mines from their submitted annual reports. Occasionally, quarterly reports were used by Environment Canada regional staff to complete missing information that was not properly reported by the owners or operators of some mines. For these facilities, a comment has been added in the appropriate summary tables presented in Appendix E indicating which information was not submitted as part of the annual report.

## 4.2 National Summary

### 4.2.1 Prescribed Deleterious Substances and pH

For the purpose of this report, performance of mines is based on an analysis of monthly effluent quality data, which include monthly mean concentrations for prescribed deleterious substances and pH range limit values that exceeded the MMER prescribed limits.

#### 4.2.1.1 Summary of Exceedances

In 2003, 106 exceedances were reported. Among the 73 facilities that were subject to the MMER in 2003, 49 facilities complied with all maximum authorized monthly mean concentrations and pH range limits, whereas 24 facilities reported at least one exceedance.

For facilities without TAs, 18 reported at least one exceedance. Among the 18 facilities for which a TA had been granted, 6 exceeded their TA limits once; of those, 4 exceeded other MMER prescribed limits as well. Tables 6 and 7 show the distribution of exceedances for facilities with and without TAs. TSS exceedances accounted for 75.5% of all exceedances. No exceedances were reported for cyanide.

**Table 6: Performance Summary for Mines without TAs**

Exceedances of Limits Prescribed in Schedule 4

#### 4.2.1.2 Summary of Performance by Jurisdiction

Figure 2 shows the distribution, by jurisdiction, of all the facilities subject to the MMER in 2003, as well as the number of facilities for which exceedances were reported.

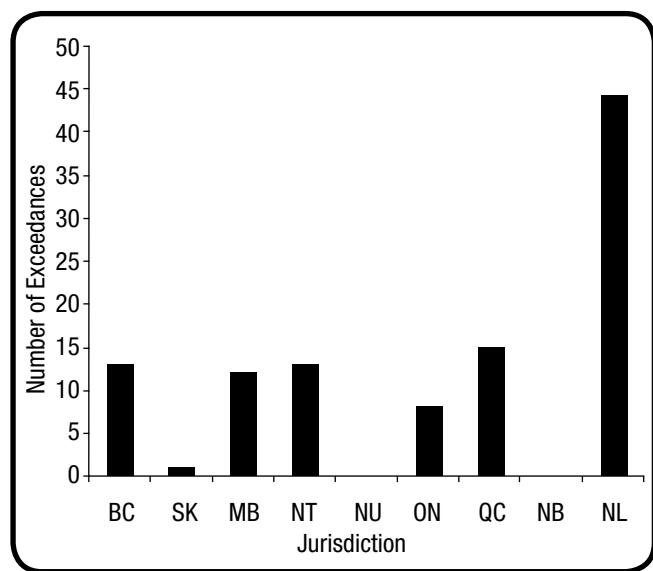

The distribution of exceedances by jurisdiction is shown in Figure 3, whereas Tables 8 and 9 provide detailed summaries of exceedances and their distribution by jurisdiction. These summary tables are provided for mines with and without TAs.

**Figure 2: Distribution of Facilities per Jurisdiction for which Exceedances were Reported (All Mines)**

Of the total number of exceedances that were reported in 2003, 41% occurred in facilities located in Newfoundland and Labrador, 14% in facilities in Quebec, 8% in Ontario, and 12% in each of Manitoba, British Columbia, and the Northwest Territories. Exceedances reported by facilities located in Saskatchewan accounted for 1%. No exceedances were reported by mines located in New Brunswick or Nunavut.

**Figure 3: Distribution of Exceedances per Jurisdiction (All Mines)**

**Table 8: Distribution of Exceedances by Jurisdiction: Mines without TAs**

Jurisdiction	As	Cu	Pb	Ni	Zn	TSS	Ra-226	pH	Total	Number of Facilities

<b>Total</b>	<b>5</b>	<b>1</b>	<b>6</b>	<b>6</b>

#### 4.2.1.3 Summary of Performance by Mining Subsector

The distribution of exceedances by mining subsector is presented in Tables 10 and 11. For mines without TAs, 43 exceedances were reported by only 2 iron ore facilities, whereas 13 base metals facilities reported 44 exceedances and 7 precious metals facilities reported 13 exceedances. No exceedances were reported by the uranium facilities.

**Table 10: Distribution of Exceedances by Mining Subsector: Mines without TAs**

Subsector	As	Cu	Pb	Ni	Zn	TSS	Ra-226	pH	Total	Number of Facilities
Base metals	2	2	1	4	1	25	7	2	<b>44</b>	13

## 4.2.2 Rainbow Trout Acute Lethality and *Daphnia magna* Monitoring Tests

Tables 12 and 13 provide an overview of rainbow trout acute lethality and *Daphnia magna* monitoring tests that were conducted in 2003 based on the MMER requirements. The distributions of tests and results are provided by jurisdiction and mining subsector. The tables show the number of samples that were acutely lethal to rainbow trout and the number of tests for which *Daphnia magna* mortality was greater than 50%. As indicated in Section 2.3.2, the MMER do not require that effluent be non-acutely lethal to *Daphnia magna*, but tests must be done, recorded, and reported each time that a rainbow trout acute lethality test is conducted. It should be noted that this assessment does not include rainbow trout and *Daphnia magna* monitoring results for the seven facilities that had a TA for acute lethality.

The main observations are as follows:

- In total, 964 and 966 tests were conducted for rainbow trout acute lethality and *Daphnia magna* monitoring, respectively.
- In 95.0% of tests for rainbow trout acute lethality, samples were not acutely lethal.

- In 94.2% of *Daphnia magna* monitoring tests, the mortality rate was less than 50%.

### 4.2.2.1 Rainbow Trout Acute Lethality Tests

The results of the rainbow trout acute lethality tests can be summarized as follows:

- Samples were acutely lethal to rainbow trout in 48 tests.
- Twelve facilities had at least one sample that was acutely lethal to rainbow trout in 2003. Of those, six facilities had only one test failure.
- Of the 48 samples that were acutely lethal, 39.6% were from facilities located in Newfoundland and Labrador, 31.25% from facilities in Quebec, and less than 10% from other jurisdictions. None of the samples from mines in Nunavut and the Northwest Territories were acutely lethal to rainbow trout.
- On a sectoral basis, 52.1% of acutely lethal samples were from the base metals subsector, 39.6% from the iron ore subsector, 6.2% from the precious metals subsector, and 2.1% from the uranium subsector.

#### 4.2.2.2 *Daphnia magna* Monitoring Tests

The results of the *Daphnia magna* monitoring tests can be summarized as follows:

- The mortality of *Daphnia magna* was greater than 50% in 56 tests.
- Seventeen facilities had at least one *Daphnia magna* test with a mortality rate greater than 50% in 2003.
- Quebec had the highest percentage (37.5%) of tests in which *Daphnia magna* mortality was greater than 50%,

followed by British Columbia (23.2%), Newfoundland and Labrador (12.5%), Manitoba (10.7%), New Brunswick (7.1%), and all other jurisdictions (about 5%), with the exception of the Northwest Territories, where *Daphnia magna* mortality was in all cases less than 50%.

- On a sectoral basis, 76.8% of tests in which *Daphnia magna* mortality was greater than 50% were from the base metals subsector, 12.5% from the iron ore subsector, 7.1% from the precious metals subsector, and 3.6% from the uranium subsector.

**Table 12: Performance Summary: Acute Lethality and *Daphnia magna* Testing, by Jurisdiction**

# 5.0 COMPLIANCE SUMMARY FOR 2003

## 5.1 Compliance Summary for Prescribed Deleterious Substances and pH

Table 14 provides an assessment of mine performance in 2003 with respect to prescribed deleterious substances and pH range limits under the MMER. The percentages of compliance for the substances are based on the number of months for which an effluent was discharged compared with the number of samples that were in compliance with the monthly mean concentration set as per either column 2 of Schedule 4 of the MMER or TA limits that were granted. The compliance assessment of pH was based on the monthly pH ranges that were in compliance with the MMER authorized limit compared with the number of months for which an effluent was discharged. The pH range values are defined as the lowest and highest values obtained from all measurements taken during a given month.

It should be noted that more than 80 monthly pH results were reported not as a range but rather as a monthly average. In some of these cases, Environment Canada staff consulted quarterly reports to determine pH ranges for those months. For cyanide and Radium 226, the number of reported results is less due to the fact that several mines do not use cyanide as a process reagent in their operation and several mines are on reduced frequency of testing for Radium 226.

The overall compliance assessment achieved by metal mines in 2003 is above 99% for all parameters with the exception of TSS, for which the compliance rate is 92.1%. A limited number of mines were challenged to routinely meet the TSS limits.

**Table 14: Compliance Summary for Prescribed Deleterious Substances and pH**

	As	Cu	CN	Pb	Ni	Zn	TSS	Ra-226	pH Low	pH High
Number of exceedances	2	2	0	1	4	2	80	7	3	5
Total number of months for which results were reported	1022	1022	311	1022	1022	1022	1021	730	938	938
Compliance rate (%)	<b>99.8</b>	<b>99.8</b>	<b>100</b>	<b>99.9</b>	<b>99.6</b>	<b>99.8</b>	<b>92.1</b>	<b>99.0</b>	<b>99.7</b>	<b>99.5</b>

## 5.2 Compliance Summary for Acute Lethality and *Daphnia magna* Monitoring Tests

The assessment of compliance rate for rainbow trout acute lethality and *Daphnia magna* monitoring tests was based on the total number of results that were reported, the number of tests that were acutely lethal to rainbow trout, and the number of tests that were acutely lethal to *Daphnia magna*. A test was considered acutely lethal when more than 50% of the species tested did not survive in an effluent at 100% concentration over a period of 96 hours.

Based on Tables 12 and 13, the compliance rates for rainbow trout acute lethality and *Daphnia magna* monitoring tests were 95.0% and 94.2%, respectively, in 2003.

## 5.3 Summary Tables and Data for Individual Mines

Data for each individual FDP for mines subject to the MMER in 2003 are listed in Appendix E. Tables are presented in alphabetical order based on mine/mill name. The tables show the summary of the monthly monitoring results of each FDP identified pursuant to sections 9 and 10 of the MMER. Data are presented as provided by the mines except where comments indicate that some data were added, for completeness, based on quarterly reports.

Supporting information includes the name of the mine or mill, the name of the operator, the list of the metal(s) that are produced, the mine address, the identification of the

final effluent discharge point, the limits of the parameters, the monthly mean concentrations of the deleterious substances, the monthly pH range (low and high), the monthly effluent volume, the results of the acute lethality tests, the results of *Daphnia magna* monitoring tests, and comments (if applicable).

Highlighted data indicate that a monthly effluent quality standard (MEQS) was exceeded for a given month. A “Pass” for the rainbow trout acute lethality test and *Daphnia magna* monitoring test indicates that the mortality rate was less than or equal to 50%. A “Fail” indicates that the mortality rate was greater than 50%.

The tables presented in Appendix D summarize the effluent quality data for mines subject to the MMER in 2003. The summaries include site identification (i.e., mine/mill name and effluent discharge name) and number of months of discharge. Table D1 summarizes the distribution of the non-compliant parameters for metals and pH, whereas Table D2 summarizes the results of rainbow trout (RT) acute lethality tests and *Daphnia magna* (DM) monitoring tests.

## 5.4 Reporting Irregularities

An examination of data provided by individual mines reveals a number of reporting irregularities. These may be summarized as follows:

- *Reporting of Results Below Detection Limits*
  - Analytical results less than the method detection limit are conventionally reported as less than the detection limit. For example, if the method detection limit for a given analysis is 0.005 mg/L, then a result less than this detection limit would, by convention, be reported as <0.005 mg/L.
  - The MMER indicate that if an analytical result is less than one-tenth of the method detection limit set out in column 4 of Schedule 3 of the MMER, the test result shall be considered to be zero (subsection 20(5)). A number of mines reported results that were greater than one-tenth of the method detection limit set out in column 4 of Schedule 3 but less than the method detection limit as zero.
- *Reporting of pH*
  - Schedule 6 of the MMER requires that a monthly pH range be provided as part of the annual report, but a number of mines provided average monthly pH instead.

- *Reporting of Flow Measurement*

- Some mines did not report flow measurements for all months.

- *Acute Lethality*

- Several mines appear to be missing at least one test for rainbow trout acute lethality.
- Some mines do not appear to be increasing the frequency of testing after failure of rainbow trout acute lethality testing.

- *Reporting of Non-Compliance*

- Schedule 6 of the MMER requires that: “If effluent was non-compliant with the authorized limits set out in Schedule 4, indicate the cause(s) of non-compliance and remedial measures planned or implemented. Also indicate remedial measures planned or implemented in response to the failure of acute lethality tests.” A number of mines did not provide this information as part of their annual reports.

- *Reporting of Effluent Volume*

- Schedule 6 of the MMER requires that mines report the effluent volume discharged for each month in which there was a discharge. A number of mines did not provide all effluent volume data.

- *Measurements Not Required*

- Schedule 6 of the MMER requires that mines identify any measurements not taken because no measurement was required (i.e., reduced frequency, cyanide not used in the process, no effluent discharge, etc.). A number of mines did not fill in their annual reports accordingly.

The new electronic reporting system called “Regulatory Information Submission System” (RISS), which is being developed and implemented by Environment Canada, will help to improve reporting accuracy and quality by minimizing/eliminating these reporting irregularities.

# 6.0 CONCLUSIONS

In 2003, 73 facilities were subject to the MMER, from which a total of 119 FDPs were identified. TAs were granted to 18 facilities. The authorizations applied to 21 FDPs for which new limits were set, on a site-specific basis, for TSS or pH or allowing the deposit of acutely lethal effluents.

From the annual reports submitted by all the metal mines subject to the MMER in 2003, the main observations are as follows:

- *Overall Compliance Assessment for Prescribed Deleterious Substances and pH*
  - Overall, the metal mining sector is achieving over 99% compliance with the prescribed limits for arsenic, copper, lead, nickel, zinc, Radium 226, and pH; only a few sporadic exceedances were reported for those prescribed parameters.
  - A 100% compliance rate was achieved by metal mines for cyanide.
  - Some mines appear to be challenged to routinely meet TSS limits, with the overall compliance rate being 92.1%.
- *Overall Assessment of Results for Rainbow Trout Acute Lethality and Daphnia magna Monitoring Tests*
  - Overall, the metal mining sector has achieved a compliance rate of 95.0% with respect to effluent that is non-acutely lethal to rainbow trout.
  - In 94.2% of *Daphnia magna* monitoring tests, the mortality rate was less than 50%.

## 7.0 FUTURE CONSIDERATIONS

Environment Canada is proposing refinements to the legal language used in the MMER, based on implementation experience, in order to improve the clarity of the Regulations. A series of amendments are presently proposed for discussion with stakeholders. Some of those amendments will contribute to improve the clarity of Schedule 6.

Based on the annual reports submitted in 2003, it is obvious that consideration needs to be given to additional promotion of compliance with respect to the requirements of Schedule 6.

Finally, the new electronic reporting system called “Regulatory Information Submission System” (RISS), which is being developed and implemented by Environment Canada, should help to improve reporting accuracy, quality, and turnaround time for public reporting.

# APPENDIX B: MINING FACILITIES SUBJECT TO THE MMER IN 2003

	Mine	Operator	Province/Territory (Location)	Products	Production Capacity	Process
1	Myra Falls Operations	Boliden Westmin (Canada) Limited	British Columbia (Vancouver Island)	Copper, zinc, gold, silver	4 000 t/d	Flotation
2	Endako	Thompson Creek Mining Limited	British Columbia (west-central BC)	Molybdenum	27 000 t/d	Flotation
3	Huckleberry Mine	Huckleberry Mines Limited	British Columbia (central BC, southwest of Houston)	Copper, molybdenum, gold, silver	21 000 t/d	Flotation
4	Eskay Creek	Barrick Gold Corporation	British Columbia (northwestern BC, east of Alaska Panhandle)	Gold, silver	300 t/d	Crushing only
5	Kemess South	Northgate Exploration Limited	British Columbia (north-central BC)	Gold, copper	49 000 t/d	Flotation
6	Cluff Lake Operation	Cogema Resources Inc.	Saskatchewan (northwestern SK, south of Lake Athabasca)	Uranium	Closed	
7	Key Lake Operation	Cameco Corporation	Saskatchewan (northern SK)	Uranium	Mill only; annual production capacity of 18 million pounds of $U_3O_8$	Leaching and solvent extraction
8	McArthur River Operation	Cameco Corporation	Saskatchewan (northern SK)	Uranium	150 t/d	Crushing only; processed at Key Lake
9	Cigar Lake Project	Cameco Corporation	Saskatchewan (northern SK)	Uranium	Mine under development	
10	McClean Lake Operation	Cogema Resources Inc.	Saskatchewan (northeastern SK, Wollaston Lake area)	Uranium	300 t/d	Leaching and solvent extraction
11	Rabbit Lake Operation	Cameco Corporation	Saskatchewan (northeastern SK, Wollaston Lake area)	Uranium	Annual production capacity of 12 million pounds of $U_3O_8$	Leaching and solvent extraction
12	Seabee Mine	Claude Resources Inc.	Saskatchewan (northern SK)	Gold	800 t/d	Cyanidation
13	Konuto Lake Mine	Hudson Bay Mining and Smelting Co. Ltd.	Saskatchewan (east-central SK, near Flin Flon, MB)	Copper, zinc, gold, silver, selenium, tellurium	800 t/d	Mining only; ore shipped to Flin Flon Mill
14	Flin Flon Complex	Hudson Bay Mining and Smelting Co. Ltd.	Manitoba (west-central MB, in Flin Flon)	Copper, lead, zinc	5 500 t/d	Flotation

	Mine	Operator	Province/Territory (Location)	Products	Production Capacity	Process
15	Trout Lake Mine	Hudson Bay Mining and Smelting Co. Ltd.	Manitoba (west-central MB, near Flin Flon)	Copper, zinc, gold, silver	2 500 t/d	Flotation
16	Chisel North Mine	Hudson Bay Mining and Smelting Co. Ltd.	Manitoba (west-central MB, near Snow Lake)	Zinc	750 t/d	Mining only; ore shipped to Stall/Snow Lake Mill
17	Snow Lake Mill	Hudson Bay Mining and Smelting Co. Ltd.	Manitoba (west-central MB, near Snow Lake)	Copper, zinc, selenium, tellurium, silver	3 600 t/d	Flotation
18	Ruttan Mine	Hudson Bay Mining and Smelting Co. Ltd.	Manitoba (northern MB, near Leaf Rapids)	Copper, zinc	Closed?	
19	Birchtree Mine	Inco Limited	Manitoba (northern MB, near Thompson)	Nickel, copper	3 175 t/d	Mining only; ore shipped to Thompson Complex
20	Thompson Mine / Mill	Inco Limited	Manitoba (northern MB, in Thompson)	Nickel, copper	12 000 t/d	Flotation
21	New Britannia Mine	Kinross Gold Corporation	Manitoba (west-central MB, near Snow Lake)	Gold	2 200 t/d	Cyanidation
22	Tanco Mine	Tantalum Mining Corporation of Canada Limited	Manitoba (southeastern MB, northeast of Winnipeg)	Tantalum, lithium, cesium, rubidium	Varies by commodity	Gravity, flotation, dry grinding, leach
23	Cantung Mine	North American Tungsten Corporation Limited	Northwest Territories (east of Yukon border)	Tungsten	3 000 t/d	Flotation
24	Con Mine	Miramar Mining Corporation	Northwest Territories (Yellowknife)	Gold	750 t/d	Cyanidation
25	Giant Mine	Miramar Mining Corporation	Northwest Territories (Yellowknife)	Gold	5 800 t/month	Mining only; ore shipped to Con Mine
26	Lupin Operations	Kinross Gold Corporation	Nunavut (western NU, northeast of Yellowknife)	Gold		
27	Polaris Mine	Cominco Mining Partnership and Teck Cominco Ltd.	Nunavut (Little Cornwallis Island)	Lead, zinc	Closed	
28	Nanisivik Mine	CanZinco Limited	Nunavut (northern Baffin Island)	Zinc, lead, silver	Closed	
29	Red Lake Mine	Goldcorp Inc.	Ontario (northwestern ON, Red Lake area)	Gold, silver	600 t/d	Gravity, cyanidation, flotation
30	Campbell Mine	Placer Dome (CLA) Limited	Ontario (northwestern ON, Red Lake area)	Gold	≥1 000 t/d	Cyanidation
31	Musselwhite Mine	Placer Dome Canada Limited	Ontario (northwestern ON)	Gold, silver	3 300 t/d	Cyanidation
32	Lac des Iles Mine	Lac des Iles Mines Limited	Ontario (northwestern ON, northwest of Thunder Bay)	Palladium, platinum, gold, copper, nickel, cobalt	15 000 t/d	Flotation

	Mine	Operator	Province/Territory (Location)	Products	Production Capacity	Process
33	Golden Giant Mine	Newmont Canada Limited	Ontario (northern ON, east of Marathon)	Gold	3 000 t/d	Cyanidation
34	Williams Mine	Williams Operating Corporation	Ontario (northern ON, east of Marathon)	Gold, silver	10 000 t/d	Cyanidation, gravity
35	Eagle River Mine	River Gold Mines Limited	Ontario (northern ON, west of Wawa)	Gold, silver	850 t/d	Mining only; ore shipped to River Gold Mill
36	Eagle River Mill (Mill, Mishi Pit, and Magnacon Mine)	River Gold Mines Limited	Ontario (northern ON, west of Wawa)	Gold, silver	1 000 t/d	Cyanidation
37	Porcupine Joint Venture (Dome Mine, Owl Creek Pit)	Placer Dome (CLA) Limited and Kinross Gold Corporation	Ontario (northeastern ON, Timmins area)			
38	Holt McDermott	Barrick Gold Corporation	Ontario (northeastern ON, Timmins area)	Gold, silver	2 500 t/d	Cyanidation
39	Kidd Mine	Falconbridge Limited	Ontario (northeastern ON, Timmins area)	Zinc, copper, cadmium, indium, cobalt, selenium, silver, palladium, platinum	10 000 t/d	Mining only; ore shipped to Kidd Metallurgical Division
40	Kidd Metallurgical Division	Falconbridge Limited	Ontario (northeastern ON, Timmins area)	Zinc, copper, cadmium, indium, cobalt, selenium, silver, palladium, platinum	10 000 t/d	Flotation
41	Montcalm	Falconbridge Limited	Ontario (northeastern ON, Timmins area)	Nickel, copper, cobalt	Mine under development	
42	Macassa Mine	Kirkland Lake Gold Inc.	Ontario (northeastern ON, Kirkland Lake area)	Gold	1 450 t/d	Cyanidation
43	McAlpine Mill	SMC (Canada) Limited	Ontario (northeastern ON, Cobalt area)	Precious metals	200 t/d Processes metallurgical wastes	Gravity and flotation
44	Lockerby Mine	Falconbridge Limited	Ontario (Sudbury area)	Copper, nickel, cobalt	≥700 t/d	Mining only; ore shipped to Strathcona Mill
45	Strathcona Tailings Treatment System (includes Fraser, Strathcona Mine and Mill, Craig and Onaping Mines; also includes Inco's Coleman and McCready East Mines)	Falconbridge Limited	Ontario (Sudbury area)	Nickel, copper, cobalt, platinum, palladium	8 200 t/d	Flotation

	Mine	Operator	Province/Territory (Location)	Products	Production Capacity	Process
46	Copper Cliff Complex (includes Clarabelle Mill, smelter, Copper Cliff North, Copper Cliff South, Creighton, Gertrude, Frood and Stobie Mines)	Inco Limited	Ontario (Sudbury area)	Nickel, copper, cobalt, platinum	27 300 t/d for Clarabelle Mill	Flotation
47	Crean Hill Mine	Inco Limited	Ontario (Sudbury area)	Nickel, copper, cobalt, platinum	Closed?	
48	Garson Mine	Inco Limited	Ontario (Sudbury area)	Nickel, copper, cobalt, platinum	2 400 t/d	Mining only; ore shipped to Copper Cliff Complex – Clarabelle Mill
49	Haley Plant	Timminco Limited	Ontario (southeastern ON, west of Ottawa)	Magnesium, calcium, strontium	7500 t/y magnesium, 900 t/y calcium	Calcining, reduction, refining, melting, casting, extruding
50	Matagami (Mine) (Bell Allard)	Noranda Inc.	Quebec (northeastern QC, near Matagami)	Zinc, copper	2 000 t/d	Flotation
51	Géant Dormant	Cambior Inc.	Quebec (northeastern QC, Abitibi region)	Gold, silver	900 t/d	Cyanidation
52	Bouchard-Hébert (Mine)	Ressources Breakwater Ltd.	Quebec (northeastern QC, Abitibi region)	Zinc, copper, gold, silver	2 800 t/d	Flotation
53	Louvicourt (Mine)	Les Ressources Aur Inc.	Quebec (northeastern QC, Abitibi region)	Copper, zinc, silver, gold	4 000 t/d	Flotation
54	Laronde	Les Mines Agnico-Eagle Ltd.	Quebec (northeastern QC, Abitibi region)	Gold, silver, copper, zinc	5 000 t/d	Flotation, leaching, gravity concentration
55	Mouska	Cambior Inc.	Quebec (northeastern QC, Abitibi region)	Gold	600 t/d	Mining only; ore shipped to Doyon Mill
56	Doyon	Cambior Inc.	Quebec (northeastern QC, Abitibi region)	Gold	3 500 t/d	Cyanidation
57	Kiena (Complexe)	Les Mines McWatters Inc.	Quebec (northeastern QC, Abitibi region)	Gold, silver	2 000 t/d	Cyanidation
58	Malartic (Usine)	Les Mines McWatters Inc.	Quebec (northeastern QC, Abitibi region)	Copper, gold, silver	3 000 t/d	Gravity, flotation, cyanidation
59	Sigma-Lamaque	Les Mines McWatters Inc.	Quebec (northeastern QC, Abitibi region)	Gold	5 000 t/d	
60	Beaufor	Mines Richmont Inc.	Quebec (northeastern QC, Abitibi region)	Gold	820 t/d	Mining only; ore shipped to Camflo
61	Camflo (Usine)	Mines Richmont Inc.	Quebec (northeastern QC, Abitibi region)	Gold	1 300 t/d (mill only)	Cyanidation
62	Principale	Ressources Meston Inc. (Ressources Campbell Inc.)	Quebec (northeastern QC, Chibougamau area)	Gold, copper	3 000 t/d (mill only)	Cyanidation

Mine		Operator	Province/Territory (Location)	Products	Production Capacity	Process
63	Joe Mann	Ressources Meston Inc. (Ressources Campbell Inc.)	Quebec (northeastern QC, Chibougamau area)	Gold, copper	1 000 t/d	Mining only; ore shipped to Camchib
64	Copper Rand (Mine)	Ressources Meston Inc. (Ressources Campbell Inc.)	Quebec (northeastern QC, Chibougamau area)	Copper, gold, silver		Gravity, flotation
65	Troilus	Corporation minière Inmet	Quebec (northeastern QC, north of Chibougamau)	Gold, copper, silver	15 000 t/d	Gravity, flotation
66	Raglan	Falconbridge Ltd.	Quebec (northern QC, west of Ungava Bay)	Nickel, copper, cobalt, platinum group metals, palladium	3 000 t/d	Flotation
67	Niobec	Services minéraux industriels Inc.	Quebec (central QC, Lac St. Jean region)	Niobium	3 500 t/d	Flotation, magnetic separation
68	Tio (Mine)	QIT-Fer et Titane Inc.	Quebec (eastern QC, north of Havre-Saint-Pierre)	Titanium, iron ore	8 000 t/d	Mining only; ore processed at plant in Sorel, QC
69	Mont-Wright (Mine)	Compagnie minière Québec Cartier	Quebec (northeastern QC, near Wabush, NL)	Iron ore	125 000 t/d	Grinding and spiral separation
70	Wabush (Scully Mine)	Cleveland-Cliffs Inc.	Newfoundland and Labrador (western Labrador, Wabush, Labrador City area)	Iron ore	54 400 t/d	Grinding, spiral and high-tension separation
71	Iron Ore Company of Canada	Iron Ore Company of Canada	Newfoundland and Labrador (western Labrador, Wabush, Labrador City area)	Iron ore	140 000 t/d	Spirals and magnetic separators, flotation
72	Nugget Pond	Richmont Mines Inc. - Newfoundland Division	Newfoundland and Labrador (north-central NL, northwest of Grand Falls)	Gold	350 t/d (mill only)	
73	Brunswick #12	Noranda Inc.	New Brunswick (northern NB, south of Bathurst)	Lead, zinc, copper, silver	10 000 t/d	Flotation

# APPENDIX C: MINING COMPANIES INCLUDED IN THE ASSESSMENT

Barrick Gold Corporation	Les Ressources Aur Inc.
Boliden Westmin (Canada) Ltd.	Mines Richmont Inc.
Cambior Inc.	Miramar Mining Corporation
Cameco Corporation	Newmont Canada Limited
CanZinco Ltd.	Northgate Exploration Ltd.
Claude Resources Inc.	Noranda Inc.
Cleveland-Cliffs Inc.	North American Tungsten Corporation Limited
Cogema Resources Inc.	Placer Dome Canada Ltd.
Cominco Mining Partnership	Placer Dome (CLA) Ltd.
Compagnie minière Québec Cartier	QIT-Fer et Titane Inc.
Corporation minière Inmet	Ressources Breakwater Ltd.
Falconbridge Ltd.	Ressources Campbell Inc.
Goldcorp Inc.	Resources Meston Inc.
Huckleberry Mines Ltd.	Richmont Mines Inc.
Hudson Bay Mining and Smelting Co. Ltd.	River Gold Mines Ltd.
Inco Ltd.	Services minéraux industriels Inc.
Iron Ore Company of Canada	SMC (Canada) Ltd.
Kirkland Lake Gold Inc.	Tantalum Mining Corporation of Canada Ltd.
Kinross Gold Corporation	Teck Cominco Ltd.
Lac des Iles Mines Ltd.	Thompson Creek Mining Ltd.
Les Mines Agnico-Eagle Ltd.	Timminco Ltd.
Les Mines McWatters Inc.	Williams Operating Corporation

# APPENDIX D: PERFORMANCE SUMMARY OF MINE EFFLUENTS IN 2003

## Note to Readers

The tables presented in this appendix summarize the effluent quality data for mines subject to the MMER in 2003. The summaries include site identification (i.e., mine/mill name and effluent discharge name) and number of months of discharge. Table D1 summarizes the distribution of the non-compliant parameters for metals and pH, whereas Table D2 summarizes the results of rainbow trout (RT) acute lethality tests and *Daphnia magna* (DM) monitoring tests. Metal exceedances represent the number of monthly mean concentrations that exceeded the prescribed limits for a given month, whereas pH exceedances represent the number of times that the monthly pH range was exceeded. The parameters included are arsenic (As), copper (Cu), cyanide (CN), lead (Pb), nickel (Ni), zinc (Zn), total suspended solids (TSS), total Radium 226 (Ra-226), and pH.

**Table D1: Summary of Exceedances for Mines Subject to the MMER in 2003: Prescribed Parameters and pH**

Mine/Mill Name	Site Identification	Effluent Discharge Name	Months of Discharge	As	Cu	CN	Pb	Ni	Zn	TSS	Ra-226	pH Low	pH High

# APPENDIX E: EFFLUENT QUALITY DATA OF MINES IN 2003

## Note to Readers

The tables presented in this appendix show the summary of the monthly monitoring results of each final discharge point identified pursuant to sections 9 and 10 of the MMER. Effluent results were provided to Environment Canada pursuant to section 22 of the MMER, which requires mines to submit annual reports to Environment Canada. The format for these reports is specified in Schedule 6 of the MMER. Data are presented as provided by the mines except where comments indicate that some data were added, for completeness, based on quarterly reports.

Supporting information includes:

- Mine/Mill Name
- Mine/Mill Operator Name
- Mine/Mill Product(s)
- Mine/Mill Address
- Identification of Final Effluent Discharge Point
- Parameter Limits
- Monthly Mean Concentrations of the Deleterious Substances
- Monthly pH Range (Low and High)
- Monthly Effluent Volume
- Results of Acute Lethality Tests
- Results of *Daphnia magna* Monitoring Tests
- Comments (if applicable)

Highlighted data indicate that a monthly effluent quality standard (MEQS) is exceeded for a given month. A “Pass” for the rainbow trout acute lethality test and *Daphnia magna* monitoring test indicates that the mortality rate was less than or equal to 50%. A “Fail” indicates that the mortality rate was greater than 50%. Tables are sorted in alphabetical order based on mine/mill name.
