Preface

Health Indicators 2005 is the sixth in a series of reports highlighting the most recent available information about the health care system, the health status of Canadians, and the determinants of health for Canada's largest regions, provinces, and territories.

Since 1999, the Canadian Institute for Health Information (CIHI) and Statistics Canada have collaborated on the Health Indicators project, developing and providing a broad range of indicators for health regions across the country. In this edition, key indicators describing health system performance and characteristics are provided for all health regions with a population of over 75,000 (covering approximately 95% of Canada's population). In addition, a selection of measures of health status and the non-medical determinants of health are listed and represent a sample of the range of indicators that are now available.

In order to provide the most up-to-date and relevant information possible, several changes have been introduced in this edition. One indicator, *ambulatory care sensitive conditions (ACSC)*, has been redeveloped so that it better reflects those health conditions that can be effectively managed in the community, thereby preventing or reducing admissions to hospital. Readers will also note changes in region structure in Ontario, and Newfoundland and Labrador, reflecting the creation of new regional entities that went into effect on April 1, 2005. Also new for this year is a feature outlining the essential steps for indicator development, from inception to publication.

The Health Indicators project has benefited greatly from consultations with our stakeholders across the country. The assistance offered by many individuals in health regions, provinces, and territories who reviewed these indicators and offered useful suggestions is gratefully acknowledged.

As always, we welcome your comments on this publication. Please send your suggestions about the indicators or priorities for future indicator development to indicators@cihi.ca.

Using This Report

Rates are provided for all health regions with populations of at least 75,000 as of July 1, 2002.

Confidence intervals are provided for most indicators to aid interpretation. The width of the confidence interval illustrates the degree of variability associated with the rate. Indicator values are estimated to be accurate within the upper and lower confidence interval 19 times out of 20 (95% confidence interval).

Please see Definitions and Data Sources at the back of this report for information on how the indicators are defined and important interpretive notes.

Symbols and Abbreviations Used in This Report

--	Figures not available
*	Data were suppressed due to small numbers
▼	Interpret with caution
95% CI	95% confidence interval
♦	Statistically different from the overall average ($p < 0.05$)
ADRLSSSS	Agence de développement des réseaux locaux de services de santé et de services sociaux
HSDA	Health Service Delivery Area
LHIN	Local Health Integration Network
RHA	Regional Health Authority

Health Indicator Framework

HEALTH STATUS

How healthy are Canadians?

Health status can be measured in a variety of ways, including well-being, health conditions, disability, or death.

Health Conditions	Human Function	Well-Being	Deaths
-------------------	----------------	------------	--------

NON-MEDICAL DETERMINANTS OF HEALTH

Non-medical determinants of health are known to affect our health and, in some cases, when and how we use health care.

Health Behaviours	Living and Working Conditions	Personal Resources	Environmental Factors
-------------------	-------------------------------	--------------------	-----------------------

HEALTH SYSTEM PERFORMANCE

How healthy is the health care system?

These indicators measure various aspects of the quality of health care.

Acceptability	Accessibility	Appropriateness	Competence
Continuity	Effectiveness	Efficiency	Safety

COMMUNITY AND HEALTH SYSTEM CHARACTERISTICS

These measures provide useful contextual information, but are not direct measures of health status or the quality of health care.

Community	Health System	Resources
-----------	---------------	-----------

EQUITY

Where Do Indicators Come From?

The Eight Essential Steps

Definitions and Data Sources

Ambulatory care sensitive conditions (ACSC):

Age-standardized inpatient acute care hospitalization rate for conditions where appropriate ambulatory care prevents or reduces the need for hospitalization, per 100,000 population under age 75.

Source: CIHI, Hospital Morbidity Database.

Breastfeeding practices:

Percentage of women aged 15 to 55 who had a baby in the previous five years and breastfed for at least four months.

Source: Statistics Canada, Canadian Community Health Survey, 2003.

Bypass surgery rate (CABG):

Age-standardized rate of coronary artery bypass graft surgery performed on inpatients in acute care hospitals, per 100,000 population aged 20 or over. Variations in bypass surgery rates may be related to utilization of coronary angiography, an alternative intervention for improving blood flow to the heart.

Source: CIHI, Hospital Morbidity Database.

Caesarean section:

Proportion of women delivering babies in acute care hospitals by caesarean section.

Source: CIHI, Hospital Morbidity Database.

Changes over time in smoking behaviour:

Smokers in 1994–1995 who became non-smokers in 2002–2003.

Source: Statistics Canada, National Population Health Survey, contains all panel members with a complete (full) response in Cycle 1 (1994–1995) and Cycle 5 (2002–2003), regardless of their response pattern in the intervening cycles.

Chlamydia:

Number of reported cases of genital chlamydia.

Source: Public Health Agency of Canada, Centre for Infectious Disease Prevention and Control.

Crimes of violence:

The rate of total crimes of violence, per 100,000 population. Violent crimes involve offences that deal with the application, or threat of application, of force to a person. These include homicide, attempted murder, various forms of sexual and non-sexual assault, robbery, and abduction. Traffic incidents that result in death or bodily harm are included under Criminal Code traffic incidents.

Source: Statistics Canada, Canadian Centre for Justice Statistics, Uniform Crime Reporting Survey.

Dependency ratio:

The ratio of the combined child population (aged 0 to 14) and elderly population (aged 65 and over) to the working-age population (aged 15 to 64). This ratio is presented as the number of dependents for every 100 people in the working-age population. Canadians aged 65 and over and those under age 15 are more likely to be socially and/or economically dependent on working-age Canadians, and they may also put additional demands on health services.

Source: Statistics Canada, Demography Division (2002 population estimates).

Exposure to second-hand smoke at home:

Non-smoking population aged 12 and over who reported that at least one person smokes inside their home every day or almost every day.

Source: Statistics Canada, Canadian Community Health Survey, 2003 health file.

Health expenditure:

Health expenditures in current dollars; expenditures per capita; percent of gross domestic product; public-sector expenditures as a percent of total spending; and expenditures by use of funds per capita.

Source: CIHI, National Health Expenditure Database, 2004.

Health professionals:

Number of health professionals (selected professions) per 100,000 population. See *Physicians* for notes about this professional group. Nursing professionals (RNs, LPNs): rates reflect nurses registered with “active-practising” status who are employed in registered or practical nursing. Rates will differ from data published by provincial and territorial regulatory authorities due to the CIHI collection, processing, and reporting methodology. Registered nurses (RNs): data from the territories include secondary registrations. Licensed practical nurses (LPNs): Nunavut data are not available for 2003. Other health professional data reflect personnel regardless of employment status and include the number of licensed pharmacists (excluding non-practicing pharmacists, honorary pharmacists, and certified clerks); licensed dentists (general practice and specialists); registered dental hygienists; active registered physiotherapists; registered chiropractors; active registered optometrists; registered dietitians; and active registered occupational therapists. Personnel per population ratios are revised annually using the most recent Statistics Canada population estimates, and therefore may differ slightly from previously published figures.

Sources: CIHI, Health Personnel Database, Registered Nurses Database, Licensed Practical Nurses Database, Southam Medical Database.

High school graduates:

Population aged 25 to 29 who have a high school graduation certificate. A measure of educational attainment and socio-economic status.

Source: Statistics Canada, 2001 Census (20% sample).

Hip fracture hospitalization:

Age-standardized acute care hospitalization rate for fracture of the hip, per 100,000 population aged 65 and over.

Source: CIHI, Hospital Morbidity Database.

Hip replacement rate:

Age-standardized rate of unilateral or bilateral hip replacement surgery performed on inpatients in acute care hospitals, per 100,000 population.

Source: CIHI, Hospital Morbidity Database.

HIV test reports:

Number of positive HIV test reports by province or territory and year of test.

Source: Public Health Agency of Canada, Centre for Infectious Disease Prevention and Control; *HIV and AIDS in Canada: Surveillance Report to June 30, 2004*.

Hysterectomy rate:

Age-standardized rate of hysterectomy provided to inpatients in acute care hospitals, per 100,000 women aged 20 and over.

Source: CIHI, Hospital Morbidity Database.

Infant mortality:

Infants who die in the first year of life, expressed as a rate per 1,000 live births. A long-established measure, not only of child health, but also of the well-being of a society. The reference period associated with these data reflects the mid-point of a three-year period.

Sources: Statistics Canada, Vital Statistics, Birth and Death Databases.

Inflow/outflow ratio:

A ratio of the number of separations from acute care hospitals within a given region divided by the number of acute care hospital discharges generated by residents of that region. An overall ratio is calculated for discharges associated with any diagnosis or procedure and separately for coronary artery bypass surgery, hip replacement, knee replacement, and hysterectomy procedures. A ratio of less than one indicates that hospital stays utilized by residents of a region exceeded hospital care provided within that region, suggesting an outflow effect. A ratio greater than one indicates hospital stays provided by a region exceeded the quantity of stays utilized by its residents, suggesting an inflow effect. A ratio of one indicates that the volume of hospital discharges in the region is equivalent to that generated by its residents, suggesting that inflow and outflow activity, if it exists at all, is balanced. A ratio of zero is an indication that none of the institutions in the region provided the service and residents received care outside of their region.

Source: CIHI, Hospital Morbidity Database.

In-hospital hip fracture rate:

The risk-adjusted rate of in-hospital hip fracture among acute care inpatients aged 65 years and over, per 1,000 discharges. Rates are based on three years of pooled data.

Source: CIHI, Discharge Abstract Database.

In-hospital 30-day acute myocardial infarction (AMI) mortality rate:

The risk-adjusted rate of all-cause in-hospital death occurring within 30 days of first admission to an acute care hospital with a diagnosis of AMI (for persons aged 20 to 105 years). Rates are based on three years of pooled data.

Source: CIHI, Hospital Morbidity Database.

In-hospital 30-day stroke mortality rate:

The risk-adjusted rate of all-cause in-hospital death occurring within 30 days of first admission to an acute care hospital with a diagnosis of stroke (for persons aged 20 to 105 years). Rates are based on three years of pooled data.

Source: CIHI, Hospital Morbidity Database.

Injury hospitalization:

Age-standardized rate of acute care hospitalization due to injury resulting from the transfer of energy (excludes poisoning and other non-traumatic injuries), per 100,000 population. Cause of injury is reported by the first valid documented external cause of injury code that meets the definition of a traumatic injury.

Source: CIHI, National Trauma Registry.

Knee replacement rate:

Age-standardized rate of unilateral or bilateral knee replacement surgery performed on inpatients in acute care hospitals, per 100,000 population.

Source: CIHI, Hospital Morbidity Database.

Life expectancy:

Life expectancy is the number of years a person would be expected to live, starting from birth (for life expectancy at birth) and similarly for other age groups, on the basis of the mortality statistics for a given observation period. A widely used indicator of the health of a population. Life expectancy measures quantity rather than quality of life. The reference period associated with these data reflects the mid-point of a three-year period.

Sources: Statistics Canada, Vital Statistics, Death Database, and Demography Division (population estimates).

Low birth weight:

Live births less than 2,500 grams, expressed as a percentage of all live births (birth weight known). Low birth weight is a key determinant of infant survival, health, and development. The reference period associated with these data reflects the mid-point of a three-year period.

Sources: Statistics Canada, Vital Statistics, Birth Database.

Physicians:

Physician counts include all active general practitioners, family practitioners, and specialist physicians as of December 31 of the reference year. The data include physicians in clinical and non-clinical practice and exclude residents and physicians who are not licensed to provide clinical practice and have requested to the Business Information Group that their data not be published. For purposes of reporting, physician specialty classification is based on postgraduate certification credentials achieved in Canada. Physicians designated as **family practitioners** include certificants of the College of Family Physicians of Canada (CCFP and CCFP-Emergency Medicine). **Specialist physicians** include certificants of the Royal College of Physicians and Surgeons of Canada and/or the College des médecins du Québec. All other physicians, including non-College of Family Physicians general practitioners, foreign-certified specialists, and other non-certified specialists, are included in the **family practice** counts. It is recognized that physician classification in this manner does not necessarily reflect the services provided by individual physicians. The range of services provided by a physician is subject to provincial licensure rules, medical service plan payment arrangements, and individual practice choices. Therefore, rates may differ from other publications. For example, the Newfoundland Medical Board (NMB) granted full or provisional licenses to 131 non-certified specialists in 2003. These physicians are counted as family practitioners in this report, but are counted as specialist physicians in the annual report of the NMB Registrar. Physician-to-population ratios are used to support health human resource planning. While physician density ratios are useful indicators of changes in physician numbers relative to the population, inference from total numbers or ratios as to the adequacy of provider resources should not be made.

Source: CIHI, Southam Medical Database.

Population estimates:

The number of people living in a geographic area. A population's size and age/sex composition impact the health status of a region and its need for health services. Population data also provide the "denominators" used to calculate rates for most health and social indicators.

Sources: Statistics Canada, Demography Division. Data are derived from the Census and administrative sources on births, deaths, and migration. Population growth for Quebec, Alberta, and British Columbia were supplied by the Institut de la statistique du Québec, Alberta Health and Wellness, and BC Stats, respectively.

Postsecondary graduates:

Persons aged 25 to 54 who have obtained a postsecondary certificate, diploma, or degree. A measure of educational attainment and socio-economic status.

Source: Statistics Canada, 2001 Census (20% sample).

Property crimes:

The rate of total property crimes, per 100,000 population. Property crimes involve unlawful acts with the intent of gaining property but do not involve the use or threat of violence against an individual. Theft, breaking and entering, fraud, and possession of stolen goods are examples of property crimes.

Source: Statistics Canada, Canadian Centre for Justice Statistics, Uniform Crime Reporting Survey.

Readmission rate—acute myocardial infarction (AMI):

The risk-adjusted rate of unplanned readmission following discharge for acute myocardial infarction (for persons aged 15 to 84 years). A case is counted as a readmission if it is for a relevant diagnosis and occurs within 28 days after the index AMI episode of care. Rates are based on three years of pooled data.

Sources: CIHI, Discharge Abstract Database, National Ambulatory Care Reporting System.

Readmission rate—asthma:

The risk-adjusted rate of unplanned readmission following discharge for asthma (for persons aged 15 to 84 years). A case is counted as a readmission if it is for a relevant diagnosis and occurs within 28 days after the index episode of care. Rates are based on three years of pooled data.

Source: CIHI, Discharge Abstract Database, National Ambulatory Care Reporting System.

Readmission rate—hysterectomy:

The risk-adjusted rate of unplanned readmission following discharge for hysterectomy (for women aged 15 to 84 years). A case is counted as a readmission if it is for a relevant diagnosis and occurs within 7 or 28 days after the index episode of care. Rates are based on three years of pooled data.

Source: CIHI, Discharge Abstract Database, National Ambulatory Care Reporting System.

Readmission rate—prostatectomy:

The risk-adjusted rate of unplanned readmission following discharge for prostatectomy (for men aged 15 to 84 years). A case is counted as a readmission if it is for a relevant diagnosis or procedure and occurs within 28 days after the index episode of care. Rates are based on three years of pooled data.

Source: CIHI, Discharge Abstract Database, National Ambulatory Care Reporting System.

Smoking status:

Population aged 12 and over who reported being a current smoker (daily or occasional).

Source: Statistics Canada, Canadian Community Health Survey, 2003.

Tuberculosis:

Number of reported new active and relapsed cases meeting the Canadian tuberculosis case definition.

Source: Public Health Agency of Canada, Centre for Infectious Disease Prevention and Control.

Unemployment rate:

Members of the labour force aged 15 and over who did not have a job during the reference period. The labour force consists of people who are currently employed and people who are unemployed, but were available to work in the reference period and had looked for work in the past four weeks. The reference period refers to a one-week period (from Sunday to Saturday) that usually includes the 15th day of the month. The unemployment rate is a traditional measure of the economy. Unemployed people tend to experience more health problems.

Source: Statistics Canada, Labour Force Survey (special tabulations).

Verotoxigenic *E. coli*:

The number of verotoxigenic *E. coli* cases reported by year. A confirmed case is defined as laboratory confirmation of infection with or without symptoms, with isolation of verotoxin producing *Escherichia coli* from an appropriate clinical specimen. This may be considered an approximate indicator of food-borne illness. It also has implications for water-borne disease issues. *E. coli* 0157 is included in the category of verotoxigenic *E. coli* (VTEC), accounting for more than 90% of cases.

Source: Public Health Agency of Canada, Centre for Infectious Disease Prevention and Control.

General Notes

- The methodology used for these indicators was designed to maximize inter-regional, inter-provincial, and inter-territorial comparability. Data presented include the latest updates available at the time of publication and may differ from those appearing in other reports.
- Health regions are defined by provincial governments as the areas of responsibility for regional health boards (that is, legislated) or as regions of interest to health care authorities. Data from regions with a population of at least 75,000 are reported. This threshold ensures greater stability in rates and reduces the risk of suppression stemming from privacy and confidentiality issues. Boundaries are those that were in effect as of April 2005.
- Data are based on a patient's *region of residence*, which may not be the same as the *region of hospitalization*.
- Hospitalizations include discharges and deaths for inpatients in acute care hospitals for the reference period. Same-day surgery (outpatient) cases and patients admitted to non-acute care hospitals (for example, chronic care, psychiatric, or rehabilitation facilities) are generally not included in the totals.
- ICD-10-CA and the Canadian Classification of Health Interventions (CCI) systems of coding diagnoses and procedures came into effect April 1, 2001, and were adopted by Newfoundland and Labrador, Prince Edward Island, Nova Scotia, parts of Saskatchewan, British Columbia, and Yukon Territory. Ontario, the remainder of Saskatchewan, Alberta, the Northwest Territories, and Nunavut implemented ICD-10-CA/CCI on April 1, 2002, and New Brunswick did so on April 1, 2003. Most of the indicators are based on data up to and including March 31, 2003, and some include data to March 31, 2004. Indicator cases that were originally coded in ICD-10-CA or CCI were extracted on the relevant codes and not the ICD-9 or CCP translations. New and revised coding standards introduced with the ICD-10-CA/CCI classification systems may affect the comparability of rates with those appearing in previous releases for some of the indicators.
- The definition of the ambulatory care sensitive conditions (ACSC) indicator has been revised. Rates are not comparable to those published by CIHI in previous years.
- Beginning with data year 2002–2003, stillbirths are included in the caesarean section rate. This change may affect the comparability of rates with those appearing in previous releases.
- The methodology for calculating the acute myocardial infarction (AMI) readmission and asthma readmission indicators, as well as the codes used to extract the in-hospital hip fracture indicator have been revised. These changes may affect the comparability of rates with those appearing in previous releases.
- The 30-day in-hospital mortality, in-hospital hip fracture and readmission indicator rates are based on a three-year average. Due to differences in the way data are collected, these indicators are not available for all provinces and territories. Therefore, the average rate (for Canada) does not include all provinces and territories.
- Standardized rates are age-adjusted using a direct method of standardization based on the July 1, 1991 population.
- See the *Health Indicators* e-publication (www.cihi.ca/indicators) for diagnosis and procedure codes used to extract the indicator data, technical notes describing the risk-adjustment methodology, and further information on any of the changes noted above.

For more information and detailed technical notes, visit www.cihi.ca or contact indicators@cihi.ca.
