## Estimates of Internal Migration Based on New and Old Methods for Combined Annual Periods 1996-1997 to 2000-2001

### Introduction

Beginning in 2001-2002, the official estimates of internal migration have been produced using a method developed recently. Due to time constraints, it was not possible to use the new method to produce the intercensal estimates from July 1, 1996 to July 1, 2001 based on 2001 geographic boundaries. The old method estimates of internal migration for 1996-1997 to 2000-2001 were merely converted into 2001 geographic boundaries.

However, many users have indicated that they would like to see the impact of the new method relative to the old method. To facilitate such a comparison, the new method has been applied to the 1996-1997 to 2000-2001 period based on 1996 geographic boundaries. These estimates can be compared to the old method estimates for 1996-1997 to 2000-2001 based on 1996 geographic boundaries.

### A. Differences between Old and New Methodologies

#### A.1 Description of Old Methodology for Producing Estimates Of Internal Migration

The major source of data used to calculate the final estimates of internal and interprovincial migration are personal (i.e. T1) tax returns obtained by Small Area and Administrative Data Division (SAADD) from Canada Customs and Revenue Agency (CCRA).

Each year, about 70% of the Canadian population file a personal tax return with CCRA. SAADD is able to improve this coverage by identifying non-filing individuals mainly through information reported by the persons filing and/or through CCRA's Child Tax Benefit file. Hence the annual coverage of the personal tax returns is improved to account for approximately 95% of the Canadian population.

Another type of population that is central to SAADD's methodology is called the "at-risk" population. The "at-risk" population refers to persons that are "at-risk" of being identified as migrants and is obtained by SAADD through the matching (using social insurance numbers) of two consecutive years of data. Hence, this population consists of migrants and non-migrants that file in two consecutive years. The "at-risk" population also includes the non-filing dependants of the matched filers. The coverage of the "at-risk" population for Canada is typically around 88%.

By comparing the place of residence at the time of filing, SAADD identifies, for those tax-filers and their dependants filing in two consecutive years, those moving, their census division of origin and their census division of destination.

The next component of SAADD's methodology is the calculation of the coverage adjustment factor (i.e. inflation factor). The first step involves calculating a coverage rate for each census division by age/sex group<sup>1</sup>, equal to SAADD's estimate of the "at risk" population divided by Demography Division's estimate of the population. Both population estimates correspond to the beginning of the migratory period. The next step involves calculating an inflation factor (IF) that is equal to the inverse of the coverage rate. Each inflation factor is then compared against its corresponding provincial inflation factor. Inflation factors found to be 10% above or below their provincial inflation factors are deemed non-central. Non-central inflation factors are replaced with provincial inflation factors. Then, the inflation factors are applied against the unadjusted out-migration flows<sup>2</sup>. Results, aggregated to the provincial level, represent the final estimates

<sup>1</sup> SAADD uses the following age groups for males and for females: less than 18, 18 to 24, 25 to 44, 45 to 64 and greater than 64.

<sup>2</sup> These are migrants who file tax returns in two consecutive years and their non-filing dependants.

of interprovincial migration for the entire population.

### **A.2 Description of New Methodology for Producing Estimates of Internal Migration**

The new methodology is the same as the old methodology except that the manner in which non-central inflation factors are identified and treated has been modified. Each inflation factor is still compared against a range of acceptable inflation factors but the acceptable range is now defined as the Canadian inflation factor plus or minus a certain estimate of inflation factor variability. Inflation factors above or below these limits are deemed non-central. Non-central inflation factors are now replaced with Canadian inflation factors. Therefore, application of the new methodology produces inflation factors that are, in general, more central with less dispersion.

### **B. Assessment of the New Methodology for Estimating Internal Migration: Final Update**

An important step in the assessment of a new methodology is to analyse the effect that the new method estimates have on provincial/territorial error of closure rates relative to that of the old method estimates. This comparison was carried out across the 3 intercensal periods 1986-1991, 1991-1996 and 1996-2001.

Table 1 portrays the 2001, 1996 and 1991 provincial and territorial error of closure rates and associated summary statistics for the new method, the old method and for the census counts of net migrants according to the question regarding place of usual residence five-years ago. Chart 1 presents the 2001 provincial/territorial error of closure rates for the new and old methods.

In Table 1, a comparison of the provincial and territorial error of closure rates obtained from using the new method and from using the census counts in each of the 3 intercensal periods reveals the following:

1991: The use of the new method is superior to the use of the census counts in 8 out of 12 provinces/territories. This is supported by summary statistics that are lower for the new method.

1996: The new method performs better than the census counts in 8 out of 12 provinces/territories. This is supported by the lower summary statistics for the new method.

2001: The use of the new method is superior to the use of the census counts in 8 out of 13 provinces/territories and is supported by lower summary statistics for the new method.

In Table 1, a comparison of the provincial/territorial error of closure rates obtained from using the new and old methods in each of the 3 intercensal periods shows the following:

1991: The new method performs better than the old method in 8 out of 12 provinces/territories. This is supported by summary statistics that are lower for the new method.

1996: The use of the new method is superior to the old method in 8 out of 12 provinces/territories. This is supported by the lower summary statistics for the new method.

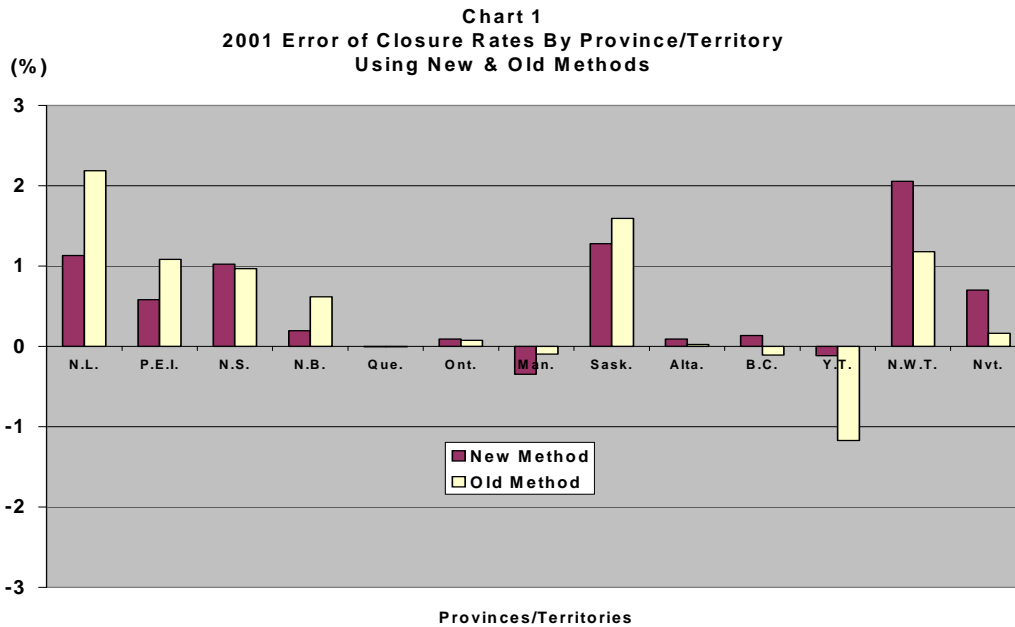

2001: The use of the old method performs better than the new method in 8 out of 13 provinces/territories. However, the summary statistics indicate that the new method is superior to the old method. As can be seen from Chart 1, the largest improvements in error of closure rates occur when switching from the old method to the new. This is evident in Newfoundland and Labrador, the Yukon, Prince Edward Island, New Brunswick and Saskatchewan. The only provinces/territories showing significantly lower error of closure rates when remaining with the old method are the

Northwest Territories, Nunavut and to a lesser extent, Manitoba.

The above results demonstrate that the provincial and territorial error of closure rates are, in general, closer to zero when using the new method rather than the old method or the census counts, regardless of the intercensal period.

2000-2001. This has been done for the following three presentations of internal migration data:

- i) for migrants by province or territory of origin and destination;
- ii) for interprovincial and intraprovincial migrants by census metropolitan area;
- iii) for interprovincial and intraprovincial migrants by province/territory, by census division.

**C. Analyses of Revisions to Internal Migration for the Combined Annual Periods 1996-1997 to 2000-2001**

The purpose of this section is to portray and analyse the revisions to the estimates of internal migration as a result of switching from the old methodology to the new methodology for the period 1996-1997 to

**C.1 Analysis of Revisions to Interprovincial Migration by Province or Territory of Origin and Destination**

For each of the five 1-year periods 1996-1997 to 2000-2001, differences between the new and old method estimates of internal migration by province/territory of origin and destination have been calculated. Results have been summed over the 5-year period. New method estimates, old method

estimates and the differences between them are presented in Tables 2, 3 and 4<sup>3</sup>.

Exhibit I portrays the 6 provinces/territories for which net migrants have been revised down, the amount of each revision, the provincial/territorial population as of July 1, 2001, the downward revision as a proportion per 1,000 provincial/territorial population<sup>4</sup>, the 5-year average provincial/territorial inflation factor and the gap between this inflation factor and the 5-year average Canadian inflation factor of 1.14.

Exhibit II portrays the same data for the 7 provinces/territories with upward revisions to net migrants.

Exhibit I indicates that the largest downward revisions to net migration as a proportion per 1,000 population occur for Newfoundland, P.E.I. and New Brunswick. These same 3 provinces exhibit 5-year average inflation factors that differ the most from the 5-year average Canadian inflation factor of 1.14. Among the 3 remaining province/territories in Exhibit I, the smallest downward revision as a proportion per 1,000 population is found for Québec. The average inflation factor for this province differs the least from the average Canadian inflation factor. To summarize, there appears to be strong positive correlation between the size of the downward revision and the proximity of the 5-year average provincial/territorial inflation factor to the 5-year average Canadian inflation factor. In fact, the correlation coefficient between these two variables is equal to 0.74<sup>5</sup>.

\* Difference with 5-year average Canadian inflation factor

**Exhibit II. Provinces/Territories with Net Migrants Revised Up For Combined Five-Year Period 1996-1997 to 2000-2001**

	New Method	Old Method	Rev.	Pop. 01/07/01	Per 1,000 Pop.	5-Yr. Avg. IF	Dif.*
1. N.S.	-5,832	-6,363	531	932,389	0.6	1.13	-0.01
2. ONT.	70,939	68,906	2,033	11,897,647	0.2	1.16	0.02
3. ALTA.	139,858	137,693	2,165	3,056,739	0.7	1.15	0.01
4. B.C.	-27,656	-37,529	9,873	4,078,447	2.4	1.19	0.05
5. Y.T.	-2,770	-3,088	318	30,129	10.6	1.18	0.04
6. N.W.T.	-3,020	-3,378	358	40,822	8.8	1.18	0.04
7. NT.	-272	-424	152	28,121	5.4	1.15	0.01

\* Difference with 5-year average Canadian inflation factor

<sup>3</sup> One must be careful to interpret correctly the estimates in Tables 2, 3 and 4. These estimates are not based on the population "at-risk" to migrate at July 1, 1996. Rather they are based on the populations "at-risk" to migrate at July 1, 1996 and at July 1, 1997... and at July 1, 2000.

<sup>4</sup> Net migrants are not used in the denominator because these estimates are sometimes so small that the statistic becomes meaningless.

<sup>5</sup> Perfect positive correlation between two variables has a correlation coefficient equal to 1. For perfect negative correlation, the coefficient is equal to -1.

Exhibit II indicates that the largest upward revisions as a proportion per 1,000 population occur for B.C., the Yukon, Nunavut and the N.W.T. and that among these 4 provinces/territories, the 5-year average inflation factors of B.C., the Yukon and the N.W.T. differ the most from the 5-year average Canadian IF of 1.14. The remaining 3 provinces (Nova Scotia, Ontario and Alberta) exhibit smaller upward revisions to net migrants in relation to their populations and are associated with smaller gaps between their 5-year average IFs and the 5-year average Canadian IF. It is evident from this table that there is some positive correlation between the revision rate of net migrants and the gaps between the provincial/territorial and Canadian IFs. This observation is supported by a correlation coefficient equal to 0.59 between these two variables. The province/territory that appears the most out of line is Nunavut and this could be due to its small size.

**C.1.1 Summary of Analysis of Revisions by Province or Territory of Origin and Destination**

1. Cumulated over the 5 years from 1996-1997 to 2000-2001, revisions to net migration by province/territory range from a downward revision of 5,502 for Newfoundland to an upward revision of 9,873 for British Columbia. Expressed as a proportion per 1,000 population, revisions to net migrants range from -10.5 per 1,000 population for Newfoundland to 10.6 per 1,000 population for the Yukon Territory.
2. There appears to be significant correlation between the size and direction of the revision and the proximity of the provincial/territorial inflation factor to the Canadian inflation factor. This statement is supported by a correlation coefficient of 0.87 between the two variables, which is calculated using data from all 13 provinces/territories. Reasons why the correlation isn't perfect may include the following:

- i) For some provinces/territories, the magnitudes of the revisions are small.
- ii) The number of inflation factors that the new methodology identifies and treats as non-central per province/territory is not proportional to the number of CDs in a province/territory.
- iii) The effect that the new methodology has on estimates of in-migrants to provinces/territories cannot be easily predicted (in contrast to that of out-migrants which usually can be) and hence the effect that revisions to in-migrants have on revisions to net migrants is difficult to predict.

**C.2 Analysis of Revisions to Interprovincial and Intraprovincial Migration by Census Metropolitan Area**

For each of the years 1996-1997 to 2000-2001, differences between the new and old method estimates of interprovincial and intraprovincial migration by census metropolitan area (CMA) have been calculated. Results have been summed over the 5-year period. New method estimates, old method estimates and the differences between them are presented in Tables 5, 6 and 7.

The old method estimates were produced by SAADD. Although SAADD tested for non-central inflation factors (IFs) at the CMA level, no IFs were identified as non-central. The new methodology also tests for non-central IFs at the CMA level (by borrowing the method used at the CD level). The results of testing for non-central inflation factors are found in Table 8. For the year 1996-97, inflation factors for 12 out of 26<sup>6</sup> CMAs are identified as non-central while 14 are identified in each of the other 4

---

<sup>6</sup>For purposes of producing estimates, it is necessary to create a residual CMA for each of the 13 provinces and territories. A residual CMA for a particular province is calculated by deducting the total of all CMA estimates in the province from the provincial estimate. Hence, for production purposes, a total of 39 CMAs are used which include 13 residual CMAs. Estimates for the 13 residual CMAs are not included in Tables 5, 6 and 7 which present estimates for the 26 non-residual CMAs.

years. Non-central inflation factors are replaced with Canadian average IFs.

### *C.2.1 Types of Revisions*

Revisions can be classified into 2 categories:

#### *Type 1*

Those due to the change in CMA methodology - since the only change in methodology is a modification of the system to identify and treat non-central IFs, a revision will occur if the inflation factor of a CMA is identified as non-central high or non-central low.

#### *Type 2*

Those due to the change in the province to province flow benchmarks that are calculated using the new methodology at the CD level and also to any change in the manner in which the revised benchmarks are allocated among the CMAs – all CMAs are affected by these benchmark revisions. For example, suppose that after applying the new methodology at the CD level, the flow from Ontario to Alberta is equal to X migrants. The new methodology is applied at the CMA level in such a manner as to preserve this benchmark (i.e. the CMA estimates also reflect a flow from Ontario to Alberta equal to X migrants).

The methodological revisions (i.e. Type 1) can be significant while the benchmark revisions (i.e. Type 2) are rarely significant.

### *C.2.2 Discussion*

From Table 7, revisions to intraprovincial out-migrants are equal to zero for Edmonton, Kitchener, London, Montreal, Regina, St. Catherines-Niagara, St. John's, Saskatoon, Sudbury, Windsor and Winnipeg. These are CMAs with IFs that are not identified as non-central in any of the 5 years from 1996-1997 to 2000-2001. See Table 8. Hence, revisions to intraprovincial out-migrants depend on

whether or not a CMA has been identified as non-central.

However, revisions to interprovincial out-migrants depend not only on whether or not a CMA has been identified as non-central but also on:

- the change in the value of the province to province benchmarks;
- any change in the manner in which the province to province benchmarks are allocated to the out-migrants of the individual CMAs.

Also, for CMAs identified with non-central high IFs, revisions to both the interprovincial and intraprovincial out-migrants are usually negative. This is due to replacing the non-central high IF with the Canadian average IF. Conversely, for CMAs identified with non-central low IFs, the revisions to both the interprovincial and intraprovincial out-migrants are usually positive. This is due to replacing the non-central low IF with the Canadian average IF. Although unlikely, a large change in the province to province benchmarks could distort these relationships.

Revisions to interprovincial and intraprovincial in-migrants depend directly on revisions to interprovincial and intraprovincial out-migrants.

### *C.2.3 Examination of Significant Revisions*

For the five 1-year periods combined, net internal migration for all metropolitan areas has been revised upwards by an estimate of 54,038 persons. See Table 7. Contributions from the three largest CMAs (i.e. Toronto, Montréal and Vancouver) represent 61.5% of the total upward revision. Four significant revisions have been identified. The first 3 are related to intraprovincial migration and the other to interprovincial migration.

1. Revision to Montréal's 1996-2001 net intraprovincial migration

The upward revision of 10,116 to Montréal's net intraprovincial migration is significant (was revised from 10,716 to 20,832). Table 8 indicates that inflation factors of 4 out of 6 CMAs in Québec have been identified as non-central low in each of the years 1997-1998, 1998-1999, 1999-2000 and 2000-2001 while for 1996-1997, 3 out of 6 have been identified as non-central low. When the IFs of these CMAs are replaced by the higher Canadian average IFs, out-migrants from these CMAs increase. But where do these out-migrants go? The majority of them become in-migrants to other CMAs in the province of Québec because residents of CMAs in Québec who out-migrate are more likely to migrate to another CMA in Québec rather than to a CMA outside of Québec. One reason for this is that the majority of persons residing in the province of Québec are likely more comfortable in French than in English and hence prefer to migrate to CMAs where French is the predominant language.

But why is the revision to Montréal's net intraprovincial migrants so large? The primary reason is that while intraprovincial in-migrants to Montréal are revised up, intraprovincial out-migrants from Montreal remain the same since Montréal's IFs are not identified as non-central in any of the 5 years.

2. Revision to Toronto's 1996-2001 net intraprovincial migration

The upward revision of 8,646 to Toronto's net intraprovincial migration is significant (was revised from -90,213 to -81,567) and is primarily due to a downward revision of 10,606 for intraprovincial out-migrants from Toronto. The inflation factor of Toronto is identified as non-central high in each of the 5 years. Even though intraprovincial out-migrants are revised down substantially for 3 out of the remaining 10 CMAs in Ontario (i.e. Hamilton, Oshawa and Ottawa), the effect of these downward revisions on revisions to intraprovincial in-migrants to Toronto is not large (i.e. is revised down 1,960).

3. Revision to Vancouver's 1996-2001 net internal migration

The upward revision of 11,911 to Vancouver's 1996-2001 net internal migration is significant and is due to a 5,299 upward revision in Vancouver's net intraprovincial migration and to a 6,612 upward revision to Vancouver's net interprovincial migration.

i) Revision to Vancouver's 1996-2001 net intraprovincial migration

The revision to Vancouver's net intraprovincial migration of 5,299 is significant (was revised from -22,787 to -17,488) and is primarily due to a downward revision of 7,970 for intraprovincial out-migrants from Vancouver. The inflation factors for Vancouver and Victoria are identified as non-central high in each of the 5 years which accounts for the downward revisions in out-migrants from these 2 CMAs.

But why does Toronto have a downward revision of 10,606 intraprovincial out-migrants compared to a similar downward revision of 7,970 for Vancouver even though intraprovincial out-migrants from Toronto exceed those from Vancouver by almost a factor of 3? The answer is that Vancouver's original inflation factors were much higher than those of Toronto in each of the 5 years but since both of these CMAs were identified with non-central high IFs, each were replaced with the same Canadian average IF.

ii) Revision to Vancouver's 1996-2001 net interprovincial migration

The upward revision of 6,612 to Vancouver's net interprovincial migration is significant (was revised from -7,337 to -725) and is primarily due to a downward revision of 7,593 for interprovincial out-migrants from Vancouver. The inflation factors of Vancouver and Victoria are identified as non-central high in each of the 5 years which accounts for the downward revisions in out-migrants from these 2 CMAs.

But why does Toronto have a downward revision of only 2,759 interprovincial out-migrants compared to a downward revision of 7,593 for Vancouver? The answer is that Vancouver's original IFs were much higher than Toronto's in each of the 5 years. Hence, after imposing the same Canadian average IF on these 2 CMAs, one would expect a lower number of out-migrants from Vancouver than from Toronto given that the level of interprovincial out-migrants from these two cities is comparable.

#### ***C.2.4 Summary of Analysis of Revisions by Census Metropolitan Area***

1. Revisions are caused by changes to CMA inflation factors and/or changes to the provincial flow benchmarks and their distribution.
2. Over the 5 year period 1996-1997 to 2000-2001, each of Montreal, Toronto and Vancouver experience upward revisions to net internal migration that exceed 10,000. For the case of Montreal, the upward revision is due to replacing non-central low IFs with Canadian average IFs for many CMAs (other than Montreal) in the province of Québec. For Toronto and Vancouver, the large upward revisions are due to replacing the IFs of these two CMAs (identified as non-central high) with Canadian average inflation factors.

#### ***C.3 Analysis of Revisions to Interprovincial and Intraprovincial Migration, Census Divisions by Province and Territory***

For each of the years 1996-1997 to 2000-2001, differences between the new and old method estimates of interprovincial and intraprovincial migration by census division (CD) have been calculated. Results have been summed over the 5-year period.

Table 9 portrays for each of the 13 provinces/territories by census division:

- i) population estimates at July 1, 2001 based on 1996 geographic boundaries
- ii) revisions to interprovincial in-, out- and net migrants
- iii) revisions to intraprovincial in-, out- and net migrants
- iv) revisions to net interprovincial net migrants expressed as a percentage of population estimates<sup>7</sup> at July 1, 2001
- v) revisions to net intraprovincial net migrants expressed as a percentage of population estimates at July 1, 2001
- vi) revisions to net internal migration

The following analysis identifies those census divisions in each province/territory that contribute significantly to revisions in

- a) net interprovincial migrants
- b) net intraprovincial migrants<sup>8</sup>

#### ***1. Newfoundland and Labrador***

The 1.0% downward revision to net interprovincial migrants for Newfoundland and Labrador is due to decreases across all census divisions. Intraprovincially, the significant upward revision in census division 1 is offset by downward revisions to most other census divisions.

#### ***2. Prince Edward Island***

For P.E.I., the 0.5% downward revision to interprovincial net migrants is attributable to

<sup>7</sup> Net migrants are not used in the denominator because these estimates are sometimes so small that the ratio becomes meaningless.

<sup>8</sup> At the provincial/territorial level, revisions to intraprovincial net migrants are equal to zero so the analysis focuses on identifying census divisions with significant offsetting revisions.

declines observed for Kings and Queens. Intraprovincially, the 1% downward revision to Kings is offset by upward revisions to Prince and Queens.

### 3. *Nova Scotia*

Halifax is primarily responsible for the upward revision of 0.1% to Nova Scotia's net interprovincial migrants. If Halifax is excluded, the revision at the provincial level falls below zero due to downward contributions from 11 of the remaining 17 census divisions. At the intraprovincial level, significant upward revisions for Annapolis and Halifax are offset by downward revisions to most of the remaining census divisions.

### 4. *New Brunswick*

Downward revisions to net interprovincial migration in all of New Brunswick's census divisions account for the 0.4% decline at the provincial level. Intraprovincially, significant upward revisions to net migrants are observed for Albert (1.1%), York (0.7%), and Westmorland (0.3%). Revisions in 10 of the remaining 12 census divisions are downward, led by Queens (-1.1%), Victoria (-0.8%) and Northumberland (-0.7%).

### 5. *Québec*

At the provincial level, net interprovincial migrants are virtually unchanged (i.e. are revised down by only 81 persons). Although the majority of revisions to census divisions are downward, a significant upward revision of 0.3% occurs for l'Outaouais. At the intraprovincial level, significant upward revisions to net migrants for l'Outaouais, Montréal, Québec City and Sherbrooke are offset by downward revisions to most of the remaining census divisions led by Lajemmerais, les Collines-de-l'Outaouais, Memphrémagog and le Val-Saint-Francois.

### 6. *Ontario*

For Ontario, net interprovincial migrants are revised up by only 2,033 persons. This rise is attributable mainly to upward revisions to Toronto and Ottawa-Carleton. At the intraprovincial level, a large upward revision to Toronto's net migrants is completely offset by significant downward revisions to York and Peel and by smaller decreases for most of the other census divisions.

### 7. *Manitoba*

For Manitoba, net interprovincial migrants are revised down in 18 of 23 census divisions resulting in a 0.2% decline at the provincial level. A 0.5% upward revision to net intraprovincial migrants for census division 11 is the primary offset to downward revisions observed in 15 of the remaining 22 census divisions.

### 8. *Saskatchewan*

Downward revisions to 17 out of 18 census divisions in Saskatchewan account for the 0.3% decrease to net interprovincial migrants at the provincial level. Intraprovincially, downward revisions to net migrants in a majority of census divisions are offset primarily by increases to census divisions 6 and 11.

### 9. *Alberta*

For Alberta, the 0.1% upward revision to net interprovincial migrants is due to increases observed for the majority of census divisions led by census divisions 6, 10, 15 and 16. The most significant downward revisions to net intraprovincial migrants are found for census divisions 2, 12 and 17. These are offset, for the most part, by an upward revision of 0.2% to census division 6.

### 10. *British Columbia*

For B.C., net interprovincial migrants are revised up in 23 out of 28 census divisions (led by the Greater Vancouver and Capital census divisions) resulting in

a 0.2% rise at the provincial level. At the intraprovincial level, significant upward revisions are observed again for the Greater Vancouver and Capital census divisions. Offsets occur in 19 census divisions led by Fraser-Valley, Cowichan Valley, Comox-Strathcona, North Okanagan, Okanagan-Similkameen and Thompson-Nicola.

### **11. Yukon**

For the Yukon, net interprovincial migrants are revised up significantly (1.1%). There is no intraprovincial migration between census divisions since the Yukon consists of only one census division.

### **12. Northwest Territories**

The large increase (0.9%) in NWT's net interprovincial migration is due to substantial upward revisions to both of its census divisions. A downward revision to Fort Smith and an upward revision to Inuvik offset each other at the intraprovincial level.

### **13. Nunavut**

The 0.5% upward revision to net interprovincial migration for Nunavut is primarily due to a significant 1.0% increase for Baffin. Revisions to net intraprovincial migration are small.

#### **C.3.1 Summary of Analysis of Revisions, Census Divisions by Province and Territory**

In general, revisions to net interprovincial migration and net intraprovincial migration at the census division level are small when expressed as a percentage of census division population.

Newfoundland and Labrador experienced the largest downward revision to interprovincial migration at the provincial/territorial level (-1.0%) so it is not surprising that the largest downward revision at the census division level is found in this province. Net

interprovincial migration in census division 4 of Newfoundland and Labrador shows a downward revision of 1.9%. In absolute terms, the largest downward revision occurs for Newfoundland and Labrador's census division 1 which posts a loss of 1,400 persons. At the other end of the spectrum, the largest upward revisions to net interprovincial migration occur in the territories. Each of the 3 territories contains at least one census division that experiences an upward revision of 1.0% or higher. The largest rise is found for Inuvik in the Northwest Territories (1.6%). In absolute terms, Greater Vancouver experiences the largest upward revision (6,612 persons).

Regarding revisions to intraprovincial migration, the largest downward revision expressed as a percentage of population is found for census division 1 in Manitoba (-2.3%). In absolute terms, York from Ontario shows the largest loss of persons (7,907). The largest percentage increase occurs in B.C.'s Central Coast (2.1%) while Toronto Metropolitan gains the most in absolute terms (21,003 persons).
