Note of Appreciation

Canada owes the success of its statistical system to a long-standing co-operation involving Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill.

- L. Two-year longitudinal job file

1994

IMPORTANT CHANGES FOR WAVE 2 RELEASE

Substantial differences between the Wave 1 and Wave 2 releases are mainly due to having an extra year of data.

There is very little change at the variable level: essentially, the variables from Wave 1 have been kept, with only a few new ones added. With one major exception, no changes to variable suppression have been made. Suppressed variables on the previous file are still suppressed and variables released on the previous file are still available. One important variable is now included on the public-use file: age in single years.

File structures have changed as a result of user feedback. To reduce the file sizes, the following measures have been taken:

- Longitudinal files have been separated from cross-sectional files.
- Suppressed variables are not included in the record layout for public-use files (however, information on suppressed variables is still included in all versions of the data dictionary.).
- The "person" files do not include any job characteristics. The "job" files include only a selection of person-level variables. Users requiring variables from more than one file must link files using the person identifier.

A total of six files are included as compared to two last year: at both the person and job levels, there will be a 1993 cross-sectional file, a 1994 cross-sectional file, and a two-year longitudinal file. Cross-sectional files can be considered final. The longitudinal files will be superseded by the three-year longitudinal files contained in the next release of public-use microdata.

CUSTOM PRODUCTS

Custom data retrievals may be ordered directly from SLID staff at Statistics Canada, as an alternative to using the public use microdata or to obtain detail that is not available on the public use file. All custom products are reviewed for confidentiality of respondent information and data reliability; some suppression of information may be required as a result of this review.

Prices for custom products reflect the full cost of producing them. Consultation with SLID staff about custom outputs is offered free of charge.

Prices of SLID microdata for the first three years of Panel 1:

Waves	Years	Base price	Discount price for purchasers of previous waves
1	1993	\$1,700	
1,2	1993 and 1994	\$2,700	\$1,000 with prior purchase of Wave 1
1,2,3	1993 to 1995	\$3,700	\$1,000 with prior purchase of Wave 2 \$2,000 with prior purchase of Wave 1

Standard discounts and premiums apply.

PRICES OUTSIDE CANADA

Unless otherwise stated on the product, prices outside Canada are the same except in US dollars; a product sold for Cdn\$50 in Canada would be sold for US\$50 outside Canada. The publication 75-201-XPE (1994 Report) is available for US\$45 in the United States and US\$52 in other countries.

1994

LICENCE AGREEMENT

How to cite SLID in publications

For publication of any information based on the SLID microdata files on CD-ROM (75M0001XCB), the following form of accreditation is recommended:

"This analysis is based on Statistics Canada's *Survey of Labour and Income Dynamics Public Use Microdata*, 1994, which contains anonymized data collected in the Survey of Labour and Income Dynamics. All computations on these microdata were prepared by (*Name of user*). The responsibility for the use and interpretation of these data is entirely that of the author(s)".

MICRODATA LICENCE AGREEMENT

BETWEEN:

HER MAJESTY THE QUEEN in right of Canada represented by the Minister of Industry having been designated as the Minister for the purposes of the Statistics Act (referred to herein as the "Owner");

AND:

(*Name of Other Party*),

(referred to herein as the "Licensee").

WHEREAS Her Majesty the Queen in right of Canada is the lawful owner of the Microdata to be licensed;

AND WHEREAS the Licensee wishes to use the licensed Microdata;

NOW THEREFORE the Parties agree as follows:

DEFINITION

1. "Microdata file" means a non-identifiable data set containing characteristics pertaining to surveyed units as described in section 2.

DESCRIPTION OF PRODUCT

- 2.(1) The Microdata file (or files) referred to in this Agreement relates to Survey of Labour and Income Dynamics Public Use Microdata (CD-ROM), 1994, 75M0001XCB.
- (2) The Microdata file is being provided for statistical and research purposes and shall not be used for any other purposes without the prior written consent of the Owner.

CONTACT AND CUSTODIAN

- 3.(1) The Licensee hereby nominates _____ as the contact person to whom all further communication shall be addressed by the Owner on any matter concerning this Agreement.
- (2) The contact person referred to in subsection (1) may only be changed upon written notice delivered to the Owner.
- (3) The Licensee hereby nominates _____ as the designated custodian of the Microdata file with responsibility for ensuring its proper use and custody pursuant to the terms of this Agreement.

LICENCE FEE AND PAYMENT

4. The total cost for the licence fee for the Microdata file referred to in section 2 shall be \$_____ to be paid by cheque or money order payable to the Receiver General for Canada and sent to:

1994

Director
Financial Operations Division
Statistics Canada
6th Floor, R.H. Coats Building
Ottawa, Ontario
K1A 0T6

DELIVERY OF PRODUCT

- 5.(1) The Owner shall provide to the Licensee's contact person as soon as practically possible one copy of the Microdata file on the medium agreed to by the parties.
- (2) The Owner shall also provide to the Licensee such documentation related to the Microdata file provided pursuant hereto as is reasonably necessary for the use of the Microdata file.

OWNERSHIP

6. The Microdata file and related documentation shall at all times be and remain the sole and exclusive property of the Owner, it being mutually agreed that this Agreement involves a licence for the use of the Microdata file and related documentation and that nothing contained herein shall be deemed to convey any title or ownership interest in the Microdata file or the related documentation to the Licensee.

LICENCE

- 7.(1) The Owner hereby grants to the Licensee a non-exclusive, non-assignable and non-transferable licence to use the Microdata file and related documentation provided pursuant to section 5 for statistical and research purposes.
- (2) No duplicates or copies of the Microdata file shall be made by the Licensee except for backup purposes. The Licensee may not copy the Microdata file or any part of them for use by anyone else, nor may they transfer or convert the data product to another format or medium for use by anyone else without written permission of the Owner.
- (3) The Licensee shall not sell, rent, lend, sub-license or transfer the Microdata file or any of its rights under this agreement to any other person or organization.

- (4) The Licensee shall not match the records on the Microdata file to any other data files so as to re-identify the survey units on the file.
- (5) The following companies have licensed for inclusion in this product the software and technology which is copyrighted by their respective companies. The respective companies retain ownership of their software. No duplication or copies of all or any part of this software shall be made by the Licensee except for backup purposes nor shall they be made accessible to others without written permission of the Owner. The Licensee may not disassemble, decompile or in any way attempt to reverse engineer any software provided as part of this product.

Survey of Labour and Income Dynamics
©Minister of Industry, 1997
All rights reserved.

Beyond 20/20. Browser
©1997 Ivation Datasystems Inc.
All rights reserved.

- (6) The Licensee shall not use any part of the product to develop or derive any other data product or data service for distribution or commercial sale, without a licence to do so.

REPRESENTATIONS AND WARRANTIES

8. The Owner warrants the medium containing the Microdata file provided to the Licensee shall be free from defects in materials and workmanship for a period of 90 days from the date of receipt. The Owner's sole obligation and the Licensee's sole remedy with respect to the foregoing warranty shall be for the Owner to replace such defective media at no charge to the Licensee upon its return to the Owner. Except as stated herein, the Owner makes no representations or warranties, expressed or implied, as to merchantability, fitness for any particular purpose or otherwise with respect to the Microdata file or the related documentation provided.

PUBLICATION BY THE LICENSEE

- 9.(1) In any publication of any information based on the Microdata file provided pursuant to this Agreement, the Licensee shall use the following form of accreditation:

1994

"This analysis is based on Statistics Canada's Survey of Labour and Income Dynamics Public Use Microdata, 1994, which contains anonymized data collected in the Survey of Labour and Income Dynamics. All computations on these microdata were prepared by (*Name of user*) and the responsibility for the use and interpretation of these data is entirely that of the author(s)".

- (2) The Licensee shall provide to Statistics Canada a copy of published research or other results based on the use of the Microdata file.

LIABILITY

10. The Owner shall not be liable to the Licensee for any design, performance, other fault or inadequacy or unauthorized use of the Microdata file or related documentation provided pursuant hereto or for damages of any kind arising out of or in any way related to or connected with such fault, inadequacy or unauthorized use of the Microdata file.

INDEMNIFICATION

11. The Licensee shall at all times indemnify and save harmless the Owner and her officers, servants and agents from and against all claims, losses, damages, costs, expenses, actions and other proceedings made, sustained, brought, prosecuted, threatened to be brought or prosecuted, in any manner based upon, caused by, or in any way attributable to the use of the Microdata file and related documentation provided pursuant hereto.

TERM

12. This Agreement comes into force when signed by both Parties and shall continue in force until terminated in accordance herewith.

TERMINATION

13. (1) The Owner may, by providing 10 days written notice to the Licensee, terminate this Agreement in the event the Licensee fails to observe any of the terms and conditions of this Agreement.
- (2) The Owner may, by providing 10 days written notice to the Licensee, terminate this Agreement without cause.
- (3) Where this Agreement is terminated pursuant to subsections 13(1) or 13(2) before the Licensee has been sent the Microdata file, the Owner shall refund to the Licensee the amount which it has received pursuant to section 4.
- (4) Where this Agreement is terminated pursuant to subsections 13(1) or 13(2) after the Licensee has been sent the Microdata file, the Licensee shall return the Microdata file and related documentation provided pursuant hereto, as well as any copies, to the Owner.

14. Any notice to be given to the Owner or the Licensee shall be sent by registered mail to:

(Address of the Owner)

(Address of the Licensee)

15. Sections 10 and 11 hereof survive the termination of this Agreement pursuant to section 13.

AMENDMENT

16. No amendment to this Agreement shall be valid unless it is reduced to writing and signed by the Parties hereto.

ENTIRE AGREEMENT

17. This Agreement constitutes the entire agreement between the Parties with respect to the subject matter hereof and supersedes all previous negotiations, communications and other agreements unless they are incorporated by reference in this Agreement.

1994

APPROPRIATE LAW

18. This Agreement shall be governed by and construed in accordance with the laws in force in the Province of _____ and any federal laws applicable thereto.

This Agreement has been executed on behalf of the Owner and the Licensee by:

FOR THE OWNER:

Philip Giles, Household Surveys Division
Statistics Canada

(1) CREATING TABLES WITH *Beyond 20/20*TM**file
open****find table
labels****change
dimensions****search****sort
dimensions****print****display
chart****go****next
item****previous
item****INTRODUCTION**

The *BEYOND 20/20*TM BROWSER enables you to quickly tabulate data to create your own custom tables. You can create a table by opening an extract and choosing up to 8 variables to work with at a time, and manipulating two or more of them in a single table layout. The buttons displayed above serve as a legend and are referred to within this document.

CREATING YOUR OWN TABLES**Opening an Extract**

To locate and open an *BEYOND 20/20*TM Extract:

- 1) Choose the **Open** command from the **File** menu or click on the **File Open** button.
- 2) Set the List Files of Type box to Extract Files (*.ivx)
- 3) Select the extract you want and click on **OK**.

As soon as you've opened an extract, the BROWSER displays an empty table view and the **source field tiles** to the right.

Viewing the Microdata

- 1) You can view **source field notes** by selecting a source field and choosing **Source Field Summary** from the **Data** menu.
- 2) Double click on the tile to see the categories or the range associated with the field, depending on whether it is character or numeric. The categories are those defined by the database, and the bands shown are those defined automatically by *BEYOND 20/20*TM (see *Define Recode* and *Define Bands*, below).
- 3) **Extract notes** can be viewed by choosing **Extract Summary** from the **Data** menu.

Positioning Tiles for Dimensions

Note: At least two dimensions must be defined before the data can be loaded (see *Generating the Table*). To select tiles for dimensions:

- 1) To locate a source field tile quickly, choose the **Find Source Field** command from the **Data** menu. Highlight the topics you want to browse. Then highlight the source field you want to use (one at a time).
- 2) Click on **OK**, and that source field tile will be located.

At this point, it is necessary to apply any modifications to the field, if desired, using the functions *Define Recode*, *Define Bands*, *Define Derived Fields*, or *Record Constraints*, below.

- 3) Drag the tile into the row dimension area at the left side of the table. When that area is highlighted, release the left mouse button.
- 4) Locate and drag a second source field tile into the column dimension at the top of the table.
- 5) Drag and drop up to six more source field tiles into the Dimension bar, which is the area above the column headings.
- 6) Character fields have both codes and labels. To switch between codes and labels, select the desired row or column and click the **Change Labels** button.

Define Recode

This option lets you create a new source field which combines categories (items) of an original character source field:

- 1) Locate and select the source field tile you want to modify and choose **Define Recode** from the **Data** menu.
- 2) If desired, enter a different New Source Field Name from the one suggested.
- 3) Type in the new code title and then highlight the codes you wish to include within that new code. Select them or deselect them using the **Add** and **Remove** buttons. The new code is automatically saved when you begin to type another new code title.
- 4) Select and enter the remaining Available Codes using the **Use As Is** feature in the Members area. This step must be completed in order to activate the OK button.
- 5) Click on **OK**. The new source field tile is created (scroll to find it). Double-click on your new source field tile in order to view the changes you have made within the .ivd file.

Define Bands

This option lets you create a new source field by changing the bands of an original numeric source field:

- 1) Locate and select the source field tile you want to modify and choose **Define Bands** from the **Data** menu.
- 2) If desired, enter a different New Source Field Name from the one suggested.
- 3) Under Initialize, enter a value for **Start** and a value for **Increment**.
- 4) Click on **Apply** in order to see the new bands. Scroll through the new bands to see the result.
- 5) Click on **OK**. You will receive a prompt saying, 'You are about to create a new field. Do you want to continue?'. Simply press **OK**. Scroll down to view your new field.

Define Derived Fields

This option lets you create a new source field by applying mathematical operations to one or more existing source field tiles.

- 1) Click on **Define Derived Field** under the **Data** menu.
- 2) One at a time, click on the Available fields that you want to use and press **Insert** to enter them in the formula.
- 3) Enter any mathematical operation in the Formula area so that it contains the formula you wish.
- 4) Enter the New Source Field Name you would like to use.
- 5) Click on **OK**.

Set Record Constraints

This option lets you create a table subject to a constraint on a field:

- 1) Choose **Record Constraints** from the **Data** menu.
- 2) Drag and drop the source field tile for which you would like a constraint.
- 3) Double-click on the text in the Criteria row. The Numeric Constraint (numeric field) or the Constraint field (character field) dialog box appears.
- 4) In the **Numeric Constraint** dialog box, select a range or comparison in the Type of Constraint area. In your select Range, enter the minimum and maximum values to be included in the constraint. If you select Comparison in the Value box, enter the value you want to use as the constraint.
- 5) In the **Constraint Field** dialog box, select one or more codes by positioning the mouse pointer over the appropriate code and clicking on the left mouse button. To select more than one adjacent code, click on and hold the left mouse button and drag the mouse until the codes you want are selected. To select non-adjacent codes, press the **CTRL** key, and click on the left mouse button.
- 6) Click on **OK**.
- 7) Repeats Steps 2-5 for each source field you want to impose constraints on. As you drag and drop the tiles, a single vertical line separates the columns that are filled. This indicates that the Browser will search for records that match all the constraints in each of the columns, indicating an "And" condition. Clicking on the **Or** button inserts a separation line to the right of the selected column. This indicates that the Browser will find all records that match all the constraints in either column, indicating an "Or" condition.
- 8) To limit the source field data that will be loaded into a table, click on **OK**. If you want to create a new extract containing a subset of the records according to the specified constraints, click on **Subset**. Save this extract and enter a new name. This new extract is independent of the original extract.

1994**Applying a Weighting Factor to the Data**

- 1) Choose **Set Weight Field** from the **Data** menu. All the numeric source fields, including the weight fields, are now listed. The different weights are listed first with a _ before the weight name.
- 2) Select the field you want to use as a weighting factor.
- 3) Click on **OK**.

Filling a table with Numeric Source Field Values

You can fill a table with values that are sums or averages of numeric source fields instead of counts:

- 1) Drag and drop the source field tile that you want values for into the cell area of the table view. The source field's type must be numeric. The BROWSER presents the **Edit Unit Item** dialog box.
- 2) The **Calculated As** area contains the statistical values you can use. Select the one you want to apply.
- 3) The **Item Name** shows the statistical method you have chosen followed by the name of the source field. Unless you change the Item name, it will be used for the new source field. Change the name if you wish.
- 4) Click on **OK**. An asterisk appears on the source field tile to indicate that the BROWSER has created a new item in the "Units" dimension.

Generating the Table

Once the table has been defined, the next step is to load the data. Simply click on the **Go** button or select **Go** from the **Data** menu. At this point you may continue to work with your table or save it for later use (see the next set of instructions, including *Saving a Table*).

go

Next
itemPre-
vious
item**WORKING WITH BROWSER TABLES**

The following instructions are based on the *BEYOND 20/20™* Browser Quickstart Guide.

Opening a Table

- 1) To open a table, click on the **Find** table button or choose Find from the **File** menu. A Find window appears.
- 2) Specify the location of the table in the directory section. A list of tables will be displayed.
- 3) Select a table and choose **OK**.

Table Browsing with 3 or more dimensions

- 1) You can browse through the items in any dimension. Select the **Active Dimension** by clicking on your choice of dimension in the Dimension bar (the area above the column headings). The dimension is now shown in the **Active Dimension** box located in the toolbar.
- 2) Click on the **Previous Item** button or the **Next Item** button to browse through the items in that dimension. Note that the active dimension tile shows the code or label of the item whose data is currently displayed.

Switching Table Dimensions

You can switch the column and row dimensions of a table by clicking and dragging the row or column and dropping it on the other.

Nesting Table Dimensions

With the left mouse button depressed, slowly drag the desired dimension tile (one that is not already occupying a row or column) from the Dimension bar to the top or bottom edge of the column labels, or to the right or left edge of the row labels, until a thick line (or highlight) appears. Release the mouse button, and the dragged dimension will be nested.

Selecting Data from a Table

You can perform the following operations by first selecting data: display only the selected data by choosing **Show** from the **Item** menu; hide the selected data from your current view by choosing **Hide** from the **Item** menu (to display the hidden data choose **Show all** from the **Dimension** menu); **chart** the data; or **copy** your selection to the clipboard and move it to another application.

- 1) To select a row or column of data, click on the corresponding row or column heading.
- 2) To select adjacent rows or columns, drag the mouse across the row or column headings.
- 3) To select non-adjacent rows and/or columns, press the CTRL key while you click on the row or column headings. All of these operations can also be accessed by clicking on the right mouse button to display the shortcut menu.

Charting Data

- 1) Select the rows and/or columns that you want to chart.
- 2) Click on the **Display Chart** button in the Tool bar.
- 3) To change the current chart type, choose the **Chart Options** command from the **View** menu, or with the mouse pointer in the chart view, click on the right mouse button to see the Charting shortcut menu.
- 4) Make a selection and click on **OK** to return to the chart view.

Chart Browsing

The ChartBrowsing™ feature lets you create a series of charts in rapid succession. With the mouse pointer in the chart view, click on one of the headings in the title of the chart to make that dimension active. Use the **Previous Item** and **Next Item** buttons to chart the previous or next item.

Printing a Table or Chart

To print a table or chart view, select **Print** from the **File** menu or click on the **Print** button.

Saving a Table

To save the table:

- 1) Choose **Save As** from the **File** menu.
- 2) Specify the directory and file name you want to save it under. Click on **OK**.
- 3) The **BROWSER** prompts you to enter summary information. Enter the Table Title and Category which will be displayed in the **Find** dialog box. If you wish, enter Keywords and Table Notes to help you find the table later.
- 4) Click on **OK**.

You can save *BEYOND 20/20™* table data in several other formats including Database files (*.dbf) and Worksheet files (*.wks). When saving to any non-*BEYOND 20/20™* format, you'll need to nest all the dimensions along the rows or columns before you save, if you want to retain the data for all dimensions (see *Nesting Table Dimensions*).

1994

OVERVIEW

The Survey of Labour and Income Dynamics (SLID) is a longitudinal household survey conducted by Statistics Canada. It is designed to capture changes in the economic well-being of individuals and families over time and the determinants of their well-being. Individuals originally selected for the survey are interviewed once or twice per year for six years to collect information about their labour market experiences, income and family circumstances. In order to obtain complete information on families and to obtain cross-sectional data, people who live with the original respondents at any time during the six years are also interviewed during the time of cohabitation.

The first reference year of the survey was 1993. A second six-year panel of respondents was introduced for 1996, halfway through the life span of the first. When the first panel ends, a third one will begin for reference year 1999. This pattern of rotating, overlapping panels will continue thereafter, with a new panel being selected every three years.

The target population for SLID is all persons living in Canada, excluding people in the Yukon or Northwest Territories, residents of institutions, persons living on Reserves, and full-time members

of the Canadian Armed Forces living in barracks. The initial sample is drawn from the Labour Force Survey at the beginning of each panel. For the first panel, the sample numbered approximately 15,000 households, comprising about 31,000 adults aged 16 years and over. When the second panel begins, it will effectively double the sample size.

While SLID's labour concepts closely reflect those of the Labour Force Survey, its collection of labour information is patterned on the earlier Labour Market Activity Survey. The income data concepts are very similar to those of the Survey of Consumer Finances.

This Guide contains information on the survey's objectives, design, content and methods. It is intended for people wishing to know more about the Survey of Labour and Income Dynamics and for analysts working with SLID microdata. It is also useful for individuals and organizations wishing to obtain aggregated SLID data directly from Statistics Canada.

INTRODUCTION TO SLID

Background

The Survey of Labour and Income Dynamics (SLID), conducted by Statistics Canada, is one of several surveys introduced in the early 1990s to fill the need for longitudinal information on individuals and families. The analytical power of longitudinal data is widely recognized, and many countries have established panel surveys to supplement their cross-sectional sources.

Around 1980, Statistics Canada began conducting retrospective labour market surveys that asked respondents to recall their work and job search activities during the previous year. As the experience in collecting retrospective information grew, so did the body of research on labour market dynamics. In the latter half of the 1980s, Statistics Canada conducted the Labour Market Activity Survey (LMAS) in two panels, the first in 1986-87 and the second in the three years from 1988 to 1990.

The drive for the Survey of Labour and Income Dynamics came in part from a group of university researchers. Experience with the Labour Market Activity Survey led to an interest in adding income information and, if possible, wealth information, to gain a more complete picture of people's economic well-being.

SLID would also include a wide range of other topics that would be expected to have an impact on people's labour market experiences or income situation. To improve the quality of income data, the possibility of linking SLID with administrative taxation data would be considered.

To finance SLID, several federal departments permanently transferred funds to Statistics Canada. This was part of an initiative in the early 1990s, undertaken to ensure that several important emerging data gaps in the national statistical program would be addressed.

A discussion paper on the proposed content of SLID was circulated to prospective data users in 1992, to obtain feedback on their priorities. The SLID content team also held meetings with a number of users and survey organizations for their direct input on the proposed content.

Those discussions helped to refine the survey content. The annual questions that would be asked were further tested in large-scale test surveys in February and May 1993.

Meanwhile in January 1993, the first panel was selected from the Labour Force Survey sample, and the first SLID interview was conducted to collect demographic and personal history information on these respondents. Then in January and May 1994, the first labour and income interviews were conducted, for reference year 1993.

1994

Objectives

The Survey of Labour and Income Dynamics supports studies on the economic well-being of individuals and families and on the processes influencing this well-being. It aims to support research on topics such as:

- # income dynamics, namely, movements into and out of poverty and the determinants of income changes experienced by individuals and families;
- # labour market dynamics and life-cycle labour market transitions, such as school-to-work transitions;
- # family dynamics, in particular their relation to economic well-being.

The individual is the basic sample unit of the survey, but family characteristics are a major focus of the survey content, as economic circumstances and resources are generally shared by family members living together.

Although SLID is first and foremost a longitudinal survey, it also generates cross-sectional data, including estimates of the number of people with a job or experiencing a period of unemployment at some time during the year, and annual wage distributions. Such new information supplements the cross-sectional data topics already covered by other surveys.

Microdata on individuals are a main focus for survey outputs, including microdata files for direct public access. Given the wide range of topics and the longitudinal nature of the information, the public-use microdata product ensures that the greatest potential can be drawn from SLID.

Major research themes

Discussions with prospective users and insights from other panel surveys with similar content helped in developing the following seven major research themes. They illustrate some of the survey's potential. Depending on the angle of study, it may make sense to use individuals, jobs, employers, or spells (of unemployment, for example) as the unit of analysis. SLID covers up to six jobs or employers that a person might have during each year.

Employment and unemployment dynamics.

Usually, labour force activity data show the net changes in employment, unemployment and inactivity between two months or years; SLID will also show the flows) how many individuals experience a change one way or the other in any time period. Flow data of persons or jobs are possible by industry, occupation, or worker characteristics. Durations of spells will be of interest too; for example, to what extent are long spells of unemployment experienced by the same individuals? What are the major determinants? Why do people withdraw from the labour market, and what precedes a transition into self-employment?

1994

Life cycle labour market transitions. One can study major labour market transitions associated with particular stages of the life cycle, such as transitions from school to work, transitions from work to retirement and work absences taken to have or raise children. What are typical life-cycle patterns in Canada today? What are the subsequent activities of high school drop-outs, and what precedes a return to school?

Job quality. SLID will support research in such areas as wage differences between men and women, under-employment, occupational mobility, earnings growth over a period of several years, and wage and hours polarisation among the working population.

Family economic mobility. How stable is family income? What proportion of families experience a significant improvement or deterioration in income between two points in time? What are the determinants of these changes? How important are changes in family composition (divorce, remarriage) in explaining a change in financial well-being?

Dynamics of low income. This research theme concerns the incidence and duration of spells of low income and the factors related to families moving into or out of low income. Researchers have used data from other longitudinal surveys to isolate and characterize a "persistently poor" subpopulation.

There will also be interest in looking at receipt of employment insurance benefits, social assistance and other government transfers in relation to flows into and out of low income.

Life events and family changes. Central to SLID's demographic potential is information on family relationships, which will make it possible to accurately identify step families and multi-generational families, for example. The longitudinal aspect will permit the study of life events and their determinants or impacts. For example, what are the family's economic circumstances preceding a marriage break-up, and what are they for each spouse and any children following a separation?

Educational advancement and combining school and work. It will be possible to view educational activity and attainment in the evolving context of an individual's other activities and family circumstances. What are the family circumstances of young people pursuing postsecondary education? How much do high school or postsecondary students combine work and school?

2**MAIN DESIGN FEATURES**

This chapter describes the key design features of which all users of SLID microdata should be aware. Additional details can be found in other chapters of this guide.

SLID is a household survey. The sample is drawn from that of the Labour Force Survey (LFS). The LFS uses an area frame and covers the population of the 10 provinces, with the exception of Indian reserves, the military and residents of institutions. The coverage of the original SLID sample is identical, with one small difference: SLID includes Armed Forces personnel living out of barracks.

The size of the first six-year panel is 15,000 households (more on panels below). This includes about 31,000 persons aged 16 years and over who answer questions about their work and income during the previous year.

Interviews

Over the six years of a panel, up to 13 interviews are conducted:

- # **A preliminary interview to collect background information.** For persons aged 15 years and over, the preliminary interview for

Panel 1 took place in January 1993, and the reference date was December 31, 1992 — effectively, the beginning of 1993. As explained later in this section, a different procedure was used for the preliminary interview for Panel 2.

Six labour interviews (every January). The labour interview refers to the previous calendar year. For the first panel, the first annual interview took place in January 1994, and the reference period was 1993. (For some topics, the reference *date* is more precisely the end of 1993.) Topics such as family relationships and educational activity are included in the labour interview.

Six income interviews (every May). Like the labour interview, the reference period is the previous calendar year. The income interview is deferred until May to take advantage of income tax time when respondents are more familiar with their records. An income interview is not required if the respondent gives Statistics Canada permission to use his or her tax information from Revenue Canada for the purposes of this survey.

Since the labour and income interviews each year both refer to the previous calendar year, together they make up one wave. This represents a kind of split-interview format. The interviews are designed to maximize consistency between reported information in January and May. Many processing decisions also reflect the treatment of the two interviews as one.

1994

Persons under 15 are not interviewed in SLID, but some information is collected on them from other household members. Young household members complete a preliminary interview in January of the year after their 15th birthday. When they turn 16 years of age, they become eligible for labour and income questions.

SLID uses computer-assisted interviewing (CAI). Paper versions of the computerized questionnaires are available for reference purposes. Due to their length, they are not included with the *Microdata User's Guide*, but they are available as separate reports in the SLID Working Paper Series (formerly called the SLID Research Paper Series) and on the CD-ROM containing the public-use microdata files. The *guide* provides full information about definitions, response categories and eligible populations for each variable, and most users should not need to refer to the original interview questions.

Cohabitants

The interview format described above reflects the exact path that a longitudinal respondent follows in SLID, disregarding non-response. All longitudinal respondents are identified at the beginning of the panel, and they are followed for six years, whether they move or not. If a household splits up, all “branches” are followed.

Likewise, new people who start to live with a longitudinal respondent during the six years following the preliminary interview are also included in the survey, although they do not contribute to the longitudinal sample. They are called “cohabitants” in SLID. The reasons for interviewing cohabitants are:

to maintain complete family and household data on longitudinal respondents;

to obtain data on a representative cross-section of the population each year.

Cohabitants follow a very similar interview format to longitudinal respondents. However, they do not begin the process until they enter the household of a longitudinal respondent, and they cease to be interviewed or followed as soon as they cease to live with a longitudinal respondent.

Sample growth and shrinkage

Table 1a illustrates the natural growth and aging of the sample, before non-response is factored in. (Non-response includes in this case longitudinal respondents who become ineligible for the survey: moves to an institution, deaths, etc.).

1994

TABLE 1a. Sample sizes *before* non-response

Collection in January	1993	1994	1995
ALL AGES			
Longitudinal	39,700	39,700	39,700
Cohabitants	...	2,100	4,300
Total	39,700	41,800	44,000
AGE 16+ YEARS			
Longitudinal	30,000	30,600	31,200
Cohabitants	...	1,400	3,000
Total	30,000	32,000	34,200

Table 1b shows the number of respondents by year, i.e. the sample sizes *after* non-response.

TABLE 1b. Sample sizes *after* non-response

Collection in January	1993	1994	1995
ALL AGES			
Longitudinal	39,700	37,100	35,600
Cohabitants	...	2,000	3,600
Total	39,700	39,100	39,200
AGED 16+ YEARS			
Longitudinal	30,000	28,500	27,900
Cohabitants	...	1,400	2,300
Total	30,000	29,900	30,200

The number of longitudinal respondents (all ages) remains fixed, but as the sample ages, additional people become eligible for the labour and income

questions. This growth can be seen in the change from year to year in the number aged 16 years and over. Starting in 1994, the survey also identified cohabitants, some of whom were newborns. New cohabitants aged 16 years and over number about 2,000 each year.

Panel design

SLID is intended to continue indefinitely. Starting with Panel 2, two panels will always be overlapping. The approach of rotating overlapping panels ensures that the sample remains representative. Panel 1 was selected in January 1993, when the preliminary interview was conducted. The second panel will start with reference year 1996, and will be similar in size to the first. The third panel will begin with reference year 1999, when the first panel will be “retired”. Starting with reference year 1997, an annual “top-up” sample will be selected to augment the cross-sectional sample. With a size of about 9,000 households, this sample will be reselected each year.

The reasons for a staggered design with more frequent introductions of new panels are improved sample representativeness over time and flexibility for introducing new survey content. The choice of a six-year panel duration depended on this design and considerations about respondent burden as well.

1994

Overlapping design of SLID panels

**Modifications
for Panel 2
preliminary
interview**

For Panel 2, a change in the preliminary interview is planned. The preliminary interview (which collects background characteristics plus brief labour information to feed into the labour interview) is postponed to January 1997 from January 1996. The preliminary and labour interviews will be conducted during the same contact, similarly to what we do for cohabitants when they first come into the sample. To stay on track in relation to the sample and ensure that we have household composition data for the beginning of 1996, we will still select a sample from the Labour Force Survey in January 1996. In that way, household changes occurring during the 1996 reference year will still be captured. This change in collection approach is consistent with that for cohabitants and is conceptually equivalent (in the sense that the same output variables can be produced) to the approach taken for Panel 1.

Microdata after each wave

The microdata for Wave 1 included the background data collected in the preliminary interview, the labour interview for 1993 and the income interview for 1993. The background data may be updated to reflect the situation at the end of 1993, based on reported events in 1993.

Each year, the content of a wave of data is the same, that is, labour and income data plus background information updated as necessary. Each year of data is cumulative; the file or files produced after each wave include all previous waves of the panel. When data from successive panels become available, they will also be provided together.

Basic points about analysis

SLID is intended primarily to support longitudinal analysis. However, due to the inclusion of cohabitants, it is also possible and useful to study the microdata from a cross-sectional viewpoint. For these purposes, both longitudinal weights and cross-sectional weights are available, and the analyst must select the appropriate weight. There is also a labour weight which is appropriate for studies focussing on the labour data and not requiring income data. When data from the second panel become available, cross-sectional analysis should normally take advantage of the two overlapping panels. The cross-sectional weights will be constructed for this purpose.

1994

The characteristics of a person's family are important indicators of economic well-being. On the public-use file, it is not possible to show family characteristics for all family members for reasons of confidentiality. A reduced sample is available for some of these data, and the individual weights of that sample are increased to sum to the population. This is the sub-sampling weight. Analysts should use it in place of longitudinal or cross-sectional weights for studying family characteristics that are subsampled on the public-use file.

More information on the weights is provided in Chapter 5, "Weights".

Users of family data from other sources may be accustomed to using the family as the unit of analysis. In longitudinal analysis, this is not possible, as family composition changes over time. The solution is to use the individual as the unit of analysis. Cross-sectional analysis at the family level is not possible using the public-use files. It is necessary to access the internal database through a custom retrieval request.

For the second wave microdata, there are six flat files:

- C 1993 cross-sectional person file
- C 1994 cross-sectional person file
- C longitudinal person file
- C 1993 cross-sectional job file
- C 1994 cross-sectional job file
- C longitudinal job file.

Data users may also define many other units of analysis, including a lengthy list of spells. Some examples of spells are marital states, unemployment spells, or absences from work — for a particular reason, or of a certain duration — and so on.

1994

3

SLID POPULATION AND FOLLOWING RULES

Population coverage

The SLID population is fundamentally the same as that of the Canadian Labour Force Survey, the source of the initial sample, except that SLID also collects some information on children. The target population for SLID is therefore all persons regardless of age residing in Canada, **excluding** residents of:

- # Yukon and Northwest Territories;
- # institutions¹, unless under six months;
- # Indian Reserves;
- # military barracks.

-
1. SLID uses the same concept of institutions as the Census of Population. It includes children's group homes and orphanages, nursing homes, chronic care hospitals, residents for senior citizens, hospitals, psychiatric institutions, treatment centres and institutions for the physically handicapped, correctional and penal institutions, young offenders' facilities and jails. School residences, monasteries, convents, etc. are not institutions. (*1991 Census Dictionary*, Catalogue 92-301).

Longitudinal respondents and cohabitants

At the time of sample selection, i.e. in January of the first reference year, all members of selected dwellings become the longitudinal respondents for the panel. In subsequent collection years, SLID surveys all household members sharing a dwelling with a longitudinal respondent, including people who were not present at the start of the panel. Such new members are called “cohabitants”. The reasons for interviewing cohabitants are first, to derive family data and second, to obtain up-to-date cross-sections of the population, without actually selecting a new sample.

Eligibility for interviews

In the six years following the preliminary interview, longitudinal respondents are followed and, if possible, interviewed regardless of where they move. (See “Following Movers”, below, for an explanation of how longitudinal respondents are followed when they move.) A typical longitudinal respondent in Panel 1 may be contacted up to thirteen times over seven years: the first year for the preliminary interview and twice in each of the six subsequent years, for the labour (January) and income (May) interviews.

Cohabitants are interviewed as long as they live with a longitudinal respondent. If they cease to live with a longitudinal respondent, their names are kept on-line during later interviews with the longitudinal respondent, in case they return. If in fact they return to the household of a longitudinal respondent, they are interviewed again.

1994

Children are not interviewed until they turn 15. However, basic demographic information is collected about all children from an adult member in their household during the January interview, in order to derive family information and information about the person's children.

Following movers

Longitudinal respondents may leave the target population as defined by the paragraph on coverage, above. However, excluding people who die, they are not dropped from collection. It is useful to continue to collect information for them so that they can remain part of the longitudinal sample. There is also the possibility that they will later come back into the target population. However, there are operational limits to SLID's capacity to follow people who move abroad or into institutions. Rules for following movers were devised because of these practical constraints.

Specifically, respondents are interviewed to the extent possible when they move to the Yukon or Northwest Territories or to the continental United States. The same is done for movers to an Indian reserve or military barracks. For persons moving to other countries or an institution, only tracing will be done to identify those who subsequently "return"; every year, their location is confirmed, and if they return, interviewing is resumed.

Source of the SLID sample

The sample for each SLID panel is a subset of the Canadian Labour Force Survey (LFS) sample. For SLID's first panel, the sample selection and first interview took place at the time of the January 1993 LFS interview. With some minor adjustments, this represents the population as of December 31, 1992.

The LFS sample is divided into six representative subsamples, called rotation groups. Once selected, a dwelling is retained in the sample for six months, and each month, one-sixth of the sample is replaced or "rotated".

To obtain a subset of the LFS sample for SLID's Panel 1, two of the six LFS rotation groups were selected. This represented about 20,000 households. About 88% of LFS respondents, or 17,000 households, agreed to provide information for SLID. About 2,000 households were dropped for cost reasons, leaving a sample of approximately 15,000 households or 31,000 respondents aged 15 and over in January 1993.² They completed the SLID preliminary interview as a supplement to the LFS interview that month.

-
2. A small sample of respondents who responded to the LFS but not the preliminary interview (about 200 households) is being followed for data quality evaluation.

Sample selection for Panel 2 was conducted in a similar fashion by selecting two LFS rotation groups in January 1996. Data collection of the preliminary interview was done differently (see Chapter 2, the section on “Modifications for Panel 2 preliminary interview”).

Except for differences in sample size and the target population, the design features of the LFS sample are maintained in the SLID sample. Non-response to the LFS also carries over to SLID. The LFS has response rates of 95% or higher.

LFS sample design

The LFS sample is drawn from an area frame and is based on a stratified, multi-stage design that uses probability sampling. The successive stratification and sampling stages are outlined below. Further information can be obtained in *Guide to Labour Force Survey Data*, Statistics Canada Catalogue 71-528-XPB and *Methodology of the Canadian Labour Force Survey, 1984-1990*, Statistics Canada Catalogue 71-526-XPB.

The LFS redesigns its sample every ten years to take advantage of the latest available census counts and characteristics. SLID’s Panel 1 reflects the 1981 Census-based design in effect when the panel was selected. However, for Panel 2, the 1991 Census-based design applies. Apart from the increased efficiency of the new design, there are features that are likely to be beneficial from SLID’s perspective. One is that total income was added as a stratification variable.

1994

LFS stratification and sampling

The main advantage of a stratified sample design is that when sampling is applied separately to many diverse strata, each stratum having a relatively homogeneous population, the efficiency of the sample is higher than that obtained from simple random sampling without stratification.

First, each province is divided into LFS economic regions (set by federal-provincial agreements). In the 1991 Census-based design, these are further subdivided by Employment Insurance Regions (EIR), which are defined by Human Resources Development Canada (HRDC). Each of the resulting strata is in turn divided into one or more “urban” areas, one “rural” area, and various “special areas” (where applicable).

Generally, the “urban” areas are large or medium-sized urban centres. For the most part, they respect geographical boundaries established for the census, such as census metropolitan areas. The area of the stratum not covered by these urban centres is considered “rural”.

Each selected urban centre is further divided into strata, such that each stratum has a relatively homogeneous population in terms of socioeconomic characteristics as identified in the census. The number of strata depends on the size of the urban centre. Within each of the strata, groups of dwellings are identified, generally city blocks, groups of blocks, or block faces. These “clusters”

are the primary sampling units (PSUs) for the urban centre. The selection of a sample of clusters from each of these strata represents the first stage of sampling in these areas.

In the largest urban centres, a sample of units in large apartment buildings is selected from a separate register based on information supplied by Canada Mortgage and Housing Corporation. The purpose of this is to ensure better representation of apartment dwellers in the sample, as well as to minimize the effect of growth in clusters due to construction of new apartment buildings.

For the 1981 Census-based design within the “rural” areas, further strata were delineated based on socioeconomic characteristics. These were the PSUs, serving the same purpose as city blocks in the urban centres, but covering relatively large geographic areas. Several of these areas were selected from each stratum in the first stage of sampling. Within each selected PSU, several clusters were then formed using well-defined physical features which were recognizable both on maps and in the field (rivers, roads, etc.). In the 1991 Census-based design, the extra stage of sampling was eliminated in most of the country, and the PSU is most often the enumeration area (EAs are geographic areas covered by individual enumerators for the census).

In the 1981 Census-based design, the special areas were made up of the LFS target population found in structures excluded from the dwelling frame — for

1994

example, live-in staff of hospitals or schools, permanent residents of hotels or motels, and civilian personnel living on military bases — and some areas of the province that are too remote to be readily accessible to LFS interviewers. For the 1991 Census-based design, the special area frame consists solely of the remote areas. All the “collective dwellings” have been integrated into the regular design. EAs also serve as the primary sampling units for special areas.

In all three types of areas, selected clusters (or EAs) are visited by enumerators in the field, to prepare a listing of all private dwellings in the cluster. From the listing, a sample of dwellings is then selected.

Cross-sectional representativeness

The SLID sample reflects fundamental population dynamics: births, deaths, geographic mobility, family splits, and so on. In general, the rules for following respondents each year and interviewing cohabitants allow the survey to represent the “new” population each year, provided that correct cross-sectional weights are applied.

There is one way that the population existing at the time may be under-represented in the years after the panel was selected. That is the case of new households formed entirely of new entrants to the target population. New immigrants are the only population group that is large enough to be of potential concern.

Immigrants who enter the household of a non-immigrant (or of an earlier immigrant who was in Canada at the time of panel selection) have the same chance as anyone else of being in the household of a longitudinal respondent and therefore being selected as a cohabitant. In other words, they are represented in the SLID sample.

However, immigrants who enter without joining up with non-immigrants have no chance of being selected for the SLID sample and they are not represented in SLID. Beginning with 1997 data, this problem will no longer exist due to the addition of the “top-up” sample. (See next section.)

There are several other types of new entrants to the SLID population, but in all cases the groups are small: previous residents of an institution, Indian reserve or military barracks, and movers from the Yukon or Northwest Territories.³

Even for new immigrants, the number of people involved is small. Based on data from the Survey of Consumer Finances, only 0.3% of households in 1991 were composed entirely of people who immigrated that year.⁴ Furthermore, the limit of each SLID panel to six years and the continuous overlapping of two panels at a time ensures that

3. Newborns are a special case of entrants: because they do not form households on their own, they should be accurately represented in the sample.

4. SLID Working Paper No. 93-19.

1994

cumulative under-representation of new immigrants is limited. In other words, the immigrant who moves to Canada between 1993 and 1996 may not be represented in Panel 1 but will be in Panel 2.

The “top-up” sample

The longitudinal sample will be augmented each year by a top-up sample to maintain cross-sectional representativity and to allow estimates to be produced with the same reliability as those now produced by the Survey of Consumer Finances. Each of the two longitudinal panels is about 15,000 households, yielding a sample of about 30,000 households on a yearly basis. Once attrition is taken into account, a top-up of about 9,000 to 10,000 households per year is needed to maintain the current reliability level of cross-sectional income data. Those in the “top-up” sample will be asked the SLID preliminary interview and labour interview in January. Following standard procedures now in place for SLID, “top-up” sample members will then choose to allow the use of administrative income data or to provide income data in a May interview. The adherence to the same collection procedures used for the “regular” sample members will facilitate the integration of data for the two sample groups into one database.

The sampling weight attached to a record indicates the number of units in the population that are represented by that unit in the sample. Examples of units are the person, family, household or job. There are four types of weights in SLID: the longitudinal weight, the cross-sectional weight, the cross-sectional labour weight, and the sub-sampling weight.

“Design effects” and weights

The complex design of the SLID samples gives rise to unequal weights for respondents. Weighted and unweighted data will therefore give very different results for distributions, averages, and so on. In addition to applying appropriate weights, microdata users should be aware that the significance level of hypothesis tests (t tests, etc.) provided automatically by statistical software packages are usually incorrect. Such packages calculate variances under the assumption of simple random sampling without stratification. For further information on applying significance tests, see Chapter 12, “Guidelines for Release (Data Quality)” and Chapter 13, “Data Quality Report”.

Longitudinal weight

The longitudinal weight reflects the population at the time of sample selection, and is generally the most appropriate for longitudinal analysis which compares data from more than one year. For the first panel, these weights sum to the population as of December 31, 1992. Only longitudinal respondents are assigned a non-zero longitudinal weight in any year. The panel's longitudinal weight is recalculated each year to take into account further non-response or attrition occurring that year. Thus, the 1994 longitudinal weight takes into account attrition occurring during 1993 and 1994.

To obtain the longitudinal weight, SLID calculates an initial weight from the LFS weights: since SLID uses only a subset of the full LFS sample, the LFS weights are adjusted so that they still add to the population.

Cross-sectional weight

The cross-sectional weight (or the cross-sectional labour weight) is appropriate to calculate estimates based on data from single years. A time series is composed of such estimates.

A different cross-sectional weight is calculated for each year except the time when the sample was first selected. For Panel 1, this is January 1993. The data collected at that time, representative of the end of 1992, can be studied using the longitudinal weight as the cross-sectional weight. This is

1994

because the longitudinal respondents for Panel 1 were a representative sample of the population at that time.

While the longitudinal weights may still be used for cross-sectional analysis, the number of longitudinal units is less than the number of cross-sectional units. Therefore, increased data reliability is obtained using the cross-sectional weights.

New cross-sectional weights for each year (except 1992) are calculated using the share approach adapted for SLID⁵. Essentially, the longitudinal weights of longitudinal respondents in each household are “shared” or redistributed among all cohabitants in the household. A non-response (attrition) adjustment is then made, followed by an adjustment to current population control totals (called post-stratification). The resulting weights are the final cross-sectional weights. This share approach and adjustments are repeated each year of the panel.

-
5. Lavallée, P., “Cross-sectional Weighting of Longitudinal Surveys of Individuals and Households Using the Weight Share Method”, *Survey Methodology*, vol. 21, no. 1, 1995, pp. 25-32.

Cross-sectional labour weight

The cross-sectional labour weight is the most appropriate weight to use with data from the cross-sectional job files. Under certain circumstances, described below, it should also be used in place of the cross-sectional weight on the person files.

The cross-sectional labour weight includes an adjustment to the cross-sectional weight to account for the fact that no job records could be obtained for people who were non-respondent to the labour interview, since missing jobs are not imputed. Non-response on either file is a concern. However, on the person file, non-response to the labour interview is apparent to the microdata user in the form of a “don’t know” value for each variable and a corresponding frequency for that value. On the job file, it results in a shortage of job *records* and causes underestimates for all variables unless the weights are adjusted upwards. The cross-sectional labour weight adjusts for almost all of the underestimation.⁶

With the new weight, the weights of individuals who are retained on the person file, but who were in households where no job information was

6. Non-response to the labour interview in January 1994 was made more acute by the loss of some data during transmission from interviewers to Statistics Canada. These problems were related to the introduction of computer-assisted interviewing.

1994

received, are added to the weights of individuals who responded to both interviews. Some underestimation of jobs will still result.

On the cross-sectional person files, the cross-sectional labour weight can be used in place of the cross-sectional weight whenever the analysis is focussed more specifically on topics covered by the labour interview. The analyst can choose to optimize data on these topics (job characteristics, absences from work, jobless periods, educational activity, disability, etc.) provided that the data on demographic and income topics are of lesser importance to the study. Specifically, the cross-sectional labour weight provides the best option for handling missing values on the labour interview topics, but with a corresponding reduction in the number of both original and imputed values for demographic and income topics.

Sub-sampling weight on the public-use file

The sub-sampling weight sometimes replaces the longitudinal weight for purposes of analysing family characteristics based on the public-use microdata. For confidentiality reasons, some data on family characteristics of individuals are available only for a sub-sample, namely, one longitudinal respondent per family. The sub-sampling weight adjusts for this reduced sample. Results using the full sample with the longitudinal weight can be obtained by contacting SLID.

No family weights

Some cross-sectional surveys provide family data based on the family as the unit of analysis. SLID uses only the individual as the unit of analysis, since the focus for family data is longitudinal, not cross-sectional. Either the longitudinal weight or the sub-sampling weight is appropriate.

Cross-sectional household surveys frequently use integrated family weighting, whereby everyone living in the same household has the same weight. In SLID, weights can vary from one family member to the next on the public-use files for confidentiality reasons. Integrated family weights are available internally for custom retrievals.

Growth and attrition

It happens with any panel survey that the number of cohabitants grows each year as the members of the original dwellings move apart and live with other people. As the total number of people interviewed grows, the cross-sectional weights are adjusted downwards to prevent spurious population growth in the results. However, the weights are also adjusted upwards each year to account for attrition (non-response and failure to trace).

1994

In adjusting for attrition, the weights of non-respondent individuals to a wave are redistributed among respondent individuals. If the characteristics of respondents and non-respondents were the same, this adjustment would be straightforward; however, it is generally accepted that there is some differential non-response, i.e. their characteristics are not the same. For example, among respondent individuals there are more employed persons and more people who have not moved. As a solution, the adjustment for non-response is carried out separately for groups of individuals having certain (known) characteristics in common.

Overlapping panels

Starting with reference year 1996, the panels overlap. When only a few consecutive years of longitudinal data are required, the sample size can be doubled by combining data from the last three years of one panel and the first three years of the next, overlapping panel. Each individual will have not just one longitudinal weight valid for six years but also two “three-year” weights valid for the first three and last three years of the panel. Different three-year weights are necessary to harmonize the observations from two panels according to their common reference period. These weights will correspond to the population at the beginning of the three-year period.

Cross-sectional weights and sub-sampling weights for the enlarged sample will also be calculated each year.

More information

The issue of choosing the appropriate weight or weights for analysis is complex. Microdata users who have questions even after reading the guidelines provided in this chapter should not hesitate to contact us.

6**COLLECTION METHODS****General**

Collection takes place in January and May, and the information collected in these two time periods corresponds to one “wave” of the survey. At the beginning of a panel, background information is collected on respondents; it does not have to be collected again for the remainder of the panel. For the first panel, the background information was collected in January of the first reference year, i.e. January 1993. The interview was carried out as a supplement to the Labour Force Survey (LFS) that month, and was called the SLID preliminary interview.

Starting with Panel 2, the preliminary interview will be conducted in January following the first reference year, together with the first labour interview. This change was introduced in part because it is less costly and, from a data perspective, it will have only a slight impact. The sample will continue to be selected at the beginning of the first reference year, such that the same LFS data on respondents will be available for the beginning of the first year (for example, labour market activities – for feeding into the labour interview – and family relationships). Background information from the preliminary interview will be derived for the beginning of the first reference year based on information reported in the labour interview.

As much as possible, each interviewer contacts the same respondents each year. The interviewers are generally the same as for the Labour Force Survey. All LFS interviewers are under the supervision of a staff of senior interviewers who are responsible for ensuring that interviewers are familiar with the concepts and procedures of the LFS and the supplementary surveys. The senior interviewers are, in turn, under the supervision of the LFS program managers, located in each of the regional offices.

Collection by computer-assisted interviewing (more on this below) is decentralised: interviewers generally work at home. They carry out the interview by telephone and transmit their data by modem to the nearest Statistics Canada regional office. For security reasons, the data are encrypted during transmission.

Proxy response is accepted in SLID, i.e. the interview is usually conducted with only one household member, who answers on behalf of all members of the household, provided he or she is knowledgeable. If not, the interviewer makes arrangements to contact other household members directly.

SLID is a voluntary survey, but high response rates are important for data quality. Interviewers are instructed to make all reasonable attempts to solicit co-operation from respondents; in no case are sampled dwellings replaced with other dwellings for reasons of non-response.

1994

Interviewers are assisted in their task through an active and ongoing respondent relations campaign. Prior to every collection period, a “respondent newsletter” with the signature of the director of the nearest regional office is sent to sampled households. The letter may serve various purposes depending on the circumstances: to inform LFS respondents that they have been selected for participation in SLID, to describe the survey and stress the importance of their participation, or to explain the choice respondents have on how to report income information. A letter is sent every year in July to thank respondents for their co-operation. Sometimes a letter is sent to non-respondent households, encouraging them to participate the next time an interviewer calls. In all cases, the objective is to encourage effective respondent participation.

Computer-assisted interviewing (CAI)

SLID uses computer-assisted interviewing, i.e. the questionnaire is designed for a laptop computer and the interviewer keys in reported information during the interview. Some of the benefits of CAI come from on-line editing of information as it is received (see “Editing” in Chapter 7 - “Data Edits and Treatment of Non-Response”). However, the potential of CAI to improve data quality includes other techniques as well. In a longitudinal survey like SLID, where the same respondents provide information over several collection periods, there is the opportunity to feed back past reported

information during the interview for each respondent. Such “dependent interviewing” becomes much easier in a computer environment.

SLID especially benefits from this technique due to the long recall period required for most topics. Often with long recall periods, “seam” problems can arise, where events and dates are incorrectly associated with the beginning or end of the reference period. By feeding back information on spells in progress one year ago, the problem can be minimized.

For example, information can be fed back about jobs held at the time of the last interview or school attendance, as in this question from the January 1995 interview:

“Based on our interview of a year ago, [Jean] was working for [Statistics Canada] around the beginning of January 1994. Is this correct?”

The respondent is asked to confirm the accuracy of past information, but the question also serves to stimulate recall while leading into questions asking about changes over the past year.

CAI also makes it possible to check for consistency between the January collection period and the May collection period. For example, if receipt of employment insurance benefits was reported in January, the interviewer can probe if no amount is reported for employment insurance benefits in May.

1994

Respondents' reaction to dependent interviewing has been favourable. In fact, respondents seem to expect interviewers to have available all the information collected a year ago. An assessment of the impact of dependent interviewing is provided in SLID Working Paper No. 95-06, *Dependent Interviewing: Impact on Recall and on Labour Market Transitions*. Working Paper No. 95-07, *Some Effects of Computer-Assisted Interviewing on the Data Quality of the Survey of Labour and Income Dynamics*, examines expectations regarding the impact of CAI on data in three areas: labour force activity, respondent-sensitive sources of income, and relationships between household members.

Special methods for income data

Special attention has been given in SLID to enhancing the quality of income data through various survey innovations. Income information is inherently difficult to collect in household surveys: it is considered highly sensitive by many people, the concepts and terms are less familiar than those of most other topics, and many people are not familiar with the exact details of their income information or that of other household members. As well, any measures to improve the collection of income data will be all the more important when questions on assets and debts are added sometime in the future. Below are described the methods currently used to improve *reported* information on income, plus an additional data source used by SLID — income tax data.

Questions on income are deferred to a special collection phase in May each year, to take advantage of income tax time when respondents are more familiar with their tax records. Conceptually, it would be sufficient to conduct a single interview in January, immediately following the reference period, but the improved quality of income information in May merits a separate collection phase at that time.

Respondents receive some information about the income interview questions about two weeks prior to the interviewer's call, in a respondent newsletter.⁷ This gives respondents time to consult documents and have information handy about themselves or other family members for whom they will be reporting. The interview proceeds very quickly if respondents have completed the items ahead of time, since they only need to repeat the item amounts line-by-line for the interviewer. Respondents are encouraged to consult their records during the interview if they have not already done so ahead of time.

7. For the 1994 and subsequent collections, an approach similar to the Survey of Consumer Finances was used, whereby each household member received a form which they could complete in preparation for the interview. Evaluations of earlier tests are contained in SLID Working Paper No. 93-15, *SLID Test 3B Results: Income Sources* and SLID Working Paper No. 93-16, *SLID Test 3B Results: Impact of Notebook*.

1994

There are two sources of income data, depending on each respondent's preference. Respondents can either report income sources during the interview or grant their permission for Statistics Canada to access their tax file data from Revenue Canada solely for the purposes of the survey. The option and the implications are very clearly outlined in the respondent newsletter prior to the interview. Then, when an interviewer contacts a household, she asks to know the preference of each member in the household. In effect, well over half of SLID's income data come directly from Revenue Canada, with respondents' consent.

The advantage for the respondent of choosing the tax route is that the income interview (for that person) is terminated right after the permission question — and no further income interviews are required for all subsequent years that they are in the survey. This represents a substantial reduction of respondent burden. Also, the data collected by the tax route are of higher quality, since tax file data are generally known to have fewer omissions and underestimates. Some reduction in survey costs is also a motivation for the tax file method.

To facilitate integration of data collected by the two sources, the SLID income questions use concepts and categories similar to those of the Revenue Canada personal income tax return. For example, respondents are encouraged to consult their financial documents such as their income tax return during the interview if they have not already done so in preparation for the interview, and appropriate

numbers of the federal income tax return are provided on the SLID income guide. But there are some differences. The differences require some adjustments in how a few detailed categories are combined to create the published categories.

Many respondents choose the tax route. In May 1995 for reference year 1994, of all respondents who answered the permission question, 63% said yes. However, the proportion of people for whom tax data are used is actually somewhat lower, since not all individuals' tax records can be identified during the matching process.

For information on the methods used to process and merge income data from the survey and administrative sources, see Theme 11, "Income sources" in Chapter 10, "Thematic Description of Content".

The testing and evaluations conducted prior to the introduction of tax file information have been summarized in the September 1994 issue of *Dynamics* ("Feasibility study of the use of tax file data") and in SLID Working Paper No. 94-11, *The Use of Tax File Data in the Survey of Labour and Income Dynamics: Summary Report*. See also SLID Working Paper No. 95-19, *Combining Administrative and Survey Data to Reduce Respondent Burden in Longitudinal Surveys*. The presentation of the permission question to respondents is given in *Dynamics*, May 1995.

7

**DATA EDITS AND
TREATMENT OF NON-RESPONSE****Processing
steps**

SLID processing can be described as being composed of the following steps: preprocessing, loading, coding, editing and imputation. Some further processing is required of the public-use microdata to ensure confidentiality.

- # **Preprocessing.** This is a set of primarily manual steps. It involves the removal of duplicate data for the same person resulting from interviewer errors and transmission difficulties; ensuring that changes in household composition and move dates are consistent; reviewing interviewer notes which may lead to data corrections.
- # **Loading.** This is the process of moving and converting the collected question responses into the variables in the internal master database. Due to complex question flows and the many derived variables, this represents a large component of the processing.
- # **Coding.** Several fields collect textual information which must be translated into a numeric code before being useful for analysis.

The assignment of these codes is a mixture of automated and manual procedures. The codes are then “loaded” into the database.

Editing. Compared with traditional data collection methods, the use of computer-assisted interviewing (CAI) allows much of the editing to be done during collection. However, not all editing is completed this way. The following section describes on-line and post-collection editing for SLID in greater detail.

Imputation. This is the process of assigning a value to variables which do not have a valid value, due to non-response at collection or to valid values suppressed as a result of data inconsistencies. See “Imputation”, below.

Editing

In general, minimal verification is applied to survey data after the interview. One key element in the editing strategy is that all editing is preliminary until collection for the entire panel is finished. That is, changes may result after further data are collected. Data drawn from Revenue Canada income tax files are complete (they do not require imputation) and are generally considered to be good.

More information about the exact editing criteria used for all data can be obtained by contacting SLID.

1994

On-line editing

CAI controls the sequence or flow of questions resulting from previous question responses, so that problems caused by incorrect flows do not have to be dealt with afterwards.

As well as checking question flows, the computer application may include checks for consistency with what was said in the same interview or an earlier interview. However, some inconsistencies may remain which require processing after collection. The issue of checking consistency between the SLID labour and income interviews is discussed below.

With dependent interviewing, it is possible that a respondent will deny some information fed back from a previous interview. To maintain a good relationship with the respondent, the interviewer must accept the information given, i.e. the denial. However, a decision remains for processing. There is no general rule, however, and the decision depends on the particular data item.

In the computer application, response categories are often bounded by ranges which may themselves be calculated by the computer to take into account information reported during the same interview. If the interviewer keys in a response outside the range, she is prompted to verify the information with the respondent, sometimes with a short explanation of why the value appears inconsistent.

Depending on whether the computer edit is “hard” or “soft”, the keyed value is rejected entirely or it can be confirmed by the interviewer before continuing. Soft edits are generally followed up with some editing later. Hard edits do not need further attention.

Consistency between labour and income information

Dependent interviewing helps to reduce inconsistencies between labour information reported in January and income information reported in May. However, not all inconsistencies of this type can be resolved during the May interview. Furthermore, a large majority of respondents report income by the tax route. Data obtained from tax records are not adjusted for inconsistencies with labour interview information, although in some cases income data collected by interview are modified. The reverse may also happen: labour data may be adjusted if they are inconsistent with income data that appear to be correct.

The table shows the types of post-collection processing checks that are made between labour and income data for each respondent.

1994

TABLE 2. Consistency between labour and income information

If known from labour interview...	...then value expected under:
Workers' compensation was received at some time during the year	<i>Worker's compensation (if missing and income data were obtained by interview, an amount will be imputed)</i>
Employment insurance benefits were received at some time during the year	<i>Employment insurance benefits</i>
For at least one job, class of worker is "Paid worker"	<i>Wages and salaries</i>
For at least one job, class of worker is "Unpaid family worker", and no other class of worker describes any of the person's jobs	<i>Earnings are zero</i>
For at least one job, class of worker is "Self-employed (incorporated business)"	<i>Wages and salaries OR (and) Investment income</i>
For at least one job, class of worker is "Self-employed (unincorporated business)"	<i>Farm self-employment income or Non-farm self-employment income, depending on the industry</i>
Age 65+, with some work experience and Canadian citizen for at least 10 years	<i>Canada Pension Plan/Quebec Pension Plan</i>

When inconsistencies are apparent from the above comparisons, the approach for resolving them depends on the source of income data. For income data collected by interview, if an amount appears missing or inconsistent, it may be imputed or edited. For income data collected from the tax source, inconsistencies are resolved if possible by changing the class of worker, provided the nature of the error is quite apparent. Otherwise, the inconsistency remains.

Total annual earnings and the composite hourly wage rate (labour interview data) may be imputed, if missing, using annual wages and salaries (income data), provided the value collected on wages and salaries is good. The total annual earnings are set to the amount for annual wages and salaries, and the composite hourly wage rate is derived from total annual earnings and information on total hours paid. Users should also be aware that the wage rate and annual earnings derived from labour interview data may be different from the annual wages and salaries.

When other labour information appears to be missing, for example if annual wages and salaries are positive but no job was reported in the labour interview, no imputation is done because of the complexity of imputing jobs and job characteristics. These inconsistencies remain in the data and can be identified by comparing job information with income information.

1994***Changes in key “fixed” variables***

Key variables like date of birth and sex, which determine eligibility for certain questions, can be corrected as part of a subsequent interview. Changes in key fixed variables should be a rare occurrence, but when they do occur, SLID accepts all updates as valid, while keeping previously collected values on the database to check against possible re-corrections. This may result in some apparent longitudinal data gaps.

Establishing household composition as of December 31

Another challenge arising in SLID is the treatment of households which change in composition between the January and May interviews. The reference date for determining eligibility for interviews is December 31. But household composition changes after that are collected in preparation for the next reference year. Collecting the labour information toward the end of January already means some changes can occur. But clearly, far more changes take place between the end of the year and the middle of May when the income information is collected. To the extent possible, SLID attempts to establish the exact household composition as of December 31 and to ensure that the information for a reference year is consistent with this.

Response rates

Both “wave” and “longitudinal” response rates apply in a panel survey, to indicate under-representation from non-response in the year (the wave) and that which is cumulative since the beginning of the panel. Cumulative non-response, also called attrition, results from both refusals or insufficient response to the interview, and from failure to trace respondents when they move.

“Wave” non-response can be measured for both the longitudinal and cross-sectional sample (the latter includes cohabitants). To avoid confusion, SLID has decided to publish only the rate based on the cross-sectional sample. Also, this rate is calculated only for households, not individuals. The issue of wave response rates in SLID is complicated by the split interview format between January and May. However, the solution is that the January and May interviews are treated as a single interview for this purpose, as they are for many other purposes.

These decisions have made it possible to limit the number of published rates to just two, defined as follows:

- # The **cross-sectional (wave) response rate** is defined at the level of households. Households eligible to be interviewed are those in which a longitudinal respondent is currently living (i.e. on December 31). A household is considered respondent for the year or wave if at least one individual in the household is respondent to the *wave*, whether a longitudinal respondent or a

1994

cohabitant. An individual is defined as respondent to the wave if he or she responded to at least one *interview* in the wave:

- # The **longitudinal (cumulative) response rate** applies only to longitudinal respondents. It is the number of responding individuals as a proportion of all longitudinal respondents originally selected for the panel⁸. An individual is considered respondent if he/she answers either the January or the May interview *in all years* of the survey up to and including that wave. Total non-response therefore increases over the panel⁹.

Cross-sectional and longitudinal response rates are shown in Table 3. Note that for 1993, the longitudinal response rate includes non-response to the Labour Force Survey (LFS) component, while the cross-sectional rate takes as its base only those who were respondent to the SLID component. Also, the cross-sectional rate applies to households while the longitudinal rate applies to individuals.

-
8. Cohabitants are excluded from this measure because, although longitudinal information could be obtained for them if they reside with a longitudinal respondent in more than one year, they are never given a longitudinal weight.
 9. Later, it may be possible to include as respondent all panel individuals with no more than one missing year of data provided that it is preceded and followed by a year in which they are respondent. This would improve the longitudinal response rate.

Together, these points account for the difference between the longitudinal and cross-sectional response rates at the time of the preliminary interview.

TABLE 3. Panel 1 response rates

Collection

1993 - Preliminary Interview

Cross-sectional or wave	Longitudinal or cumulative
----------------------------	-------------------------------

89.5%	84.8%
--------------	--------------

1994 - Labour and Income Interviews

Cross-sectional or wave	Longitudinal or cumulative
----------------------------	-------------------------------

91.9% *	77.9% *
----------------	----------------

1995 - Labour and Income Interviews

Cross-sectional or wave	Longitudinal or cumulative
----------------------------	-------------------------------

<i>To be determined</i>	<i>To be determined</i>
-------------------------	-------------------------

*The response rate after imputation is somewhat higher.

1994

The experience of the Panel Survey of Income Dynamics (PSID) is interesting. That survey, started in 1968, has achieved exceedingly high response in every year except the first. During the first year, 76% of sampled families were successfully interviewed. The rate in the next year based on sampled families was 88.5%, and since then has been over 95%. The PSID makes great efforts to convert refusals during its lengthy field period from March to September. It also pays respondents for each interview they complete and for returning change-of-address cards.

The implementation of computer-assisted interviewing (CAI) may have some impact on response compared to a paper and pencil environment. It offers many benefits, but the technology is still new at Statistics Canada and there is much to learn. For example, CAI implies a decentralized system involving transmission of data from the interviewer to the regional office. There were some difficulties in transmission during 1994 associated with the start-up of CAI (the 1993 interview was paper and pencil). Response rates may therefore improve in Panel 2.

For more information, see “Measuring Response”, *Dynamics*, Vol. 3 No. 4 (December 1994) and SLID Working Paper No. 94-16, *Measuring Non-Response in a Longitudinal Survey: The Experience of the Survey of Labour and Income Dynamics*.

Imputation

Certain types of data may be imputed when non-response occurs. Imputation involves replacing a missing value with a fictitious but reasonable value, for example one that reflects the previous experience of that individual or which is taken from another individual with similar characteristics.

In SLID, there are some cases where complete non-response by an individual to an interview is dealt with by imputation rather than by the usual method of redistributing the weight of the non-respondent individual to other respondent individuals. The decision is sometimes based on the response status of all members in the household rather than the individual.

If the person responded to both interviews or just one interview in the wave (labour or income), we impute the missing data. If he/she did not respond to either interview, we still impute a limited amount of information for that person *if at least one member of the household* completed at least one of the interviews in the wave. For individuals who do not fit these criteria, the solution is to redistribute weights.

For the 1993 and 1994 reference years, imputation has been carried out for certain variables only, as follows:

1994

Variables excluding labour and income

Only the key variables necessary for weighting, namely, province, age, and sex, are imputed. This information is available for almost all longitudinal respondents, since it is obtained from the LFS at the time of the preliminary interview. When required for cohabitants, it may be imputed using other characteristics of the individual or the values of individuals in the same household.

Labour

Most variables related exclusively to the labour interview were not imputed for 1993 or 1994, due to time limitations and the absence of pertinent information from which to impute values. Job-specific variables for total hours paid and/or hourly wage rate were imputed where possible. For later years, more labour variables may be imputed using information provided by the respondent during the previous wave.

Income

Data obtained from the tax route are considered to be complete and therefore imputation is not necessary for them. For interview data, the primary method for imputing values is to use the previous year's data, updated for any changes in circumstances. In the absence of such data, income figures may be imputed using the following methods:

- # Imputation using the “nearest neighbour” method for the following variables: wages and salaries, pension income, investment income, self-employment income, employment insurance benefits, and social assistance. This involves identifying another individual with certain similar characteristics, who becomes the “donor” for the imputed value. Where possible, donors are selected among respondents who chose the tax route or respondents whose information in the income interview appears complete.
- # For many government programs, it is possible to determine whether the person was eligible and the amount that they would normally receive based on other characteristics. Items imputed in this deterministic way are: the Child Tax Benefit, Goods and Services Tax Credit, Guaranteed Income Supplement and Spouse’s Allowance.
- # Federal and provincial tax payable are imputed using linear regression.

For a description of the appearance of missing values on the file, see “Missing values and reserved codes” in Chapter 11, “Guidelines for Analysis and Presentation”.

CONFIDENTIALITY OF THE PUBLIC-USE MICRODATA

The production of a public-use microdata file includes many safeguards to prevent the identification of any one person. Longitudinal surveys are faced with an extra challenge when it comes to ensuring confidentiality, because data are collected for the same people for several years. The number of topics covered in SLID also contributes to the amount of processing required specifically to ensure confidentiality.

Confidentiality of the public-use file is ensured mainly by reducing information, i.e. deleting whole variables or suppressing or collapsing some of their detail. The data dictionary shows which variables have been suppressed on the public-use file. On the internal file, which has restricted access, these variables appear without suppression or modification. Users may wish to use some of the suppressed information in their analysis. Two options exist:

Custom retrievals

This is the simplest approach, but can also be the most costly. In consultation with a survey analyst, the data user specifies the required tables. A survey officer produces the tables using the internal

survey database. Suppression of the values in certain cells is performed for reasons of confidentiality and/or data quality. The output is then delivered to the client. The charge to the client is based on Statistics Canada's costs related to the request, i.e. cost recovery.

The next approach is priced the same way, but since it involves less cost for Statistics Canada, it is less costly to the user:

“Do-it-yourself” custom retrievals

A data user may write a program to be sent to Statistics Canada in electronic form and run against the internal database. (Some limited testing is also possible using the values on the suppressed fields.) The output is reviewed by survey staff to ensure that no risk to confidentiality exists. After this step, the program results are delivered to the client. The cost is lower than that of custom retrievals. For those wishing to follow this approach, record layouts for the internal database are available upon request.

This “do-it-yourself” approach has many of the same elements as the remote access system currently being developed within Statistics Canada. Under remote access, the electronic delivery mechanisms are more specific and formal, and further reduce the involvement of Statistics Canada staff, thus leading to a greater reduction in costs and turnaround time. More details on the remote

1994

access system will be provided in *Dynamics* as SLID becomes more involved.

For more information on custom retrievals or on how to submit a program, please contact the Dissemination Unit.

Confidentiality measures for the first wave of the first panel took into account the data which would be added from later waves, so that data for later waves would not have to be excessively modified. Meanwhile, some examination of other longitudinal surveys was carried out to estimate the impact that additional years of data will have, for example, what patterns of change are common or rare over time.

SLID uses a number of techniques to ensure confidentiality:

- # **All the variables which would permit direct identification of individuals are, of course, deleted from the file.** This includes name, telephone number, and other data used for collection purposes;
- # **No geographic detail below the provincial level** is available on the file;
- # **Down-scaling of numerical values** so that the resulting variable is categorical. An example is the person's year of first marriage, which is replaced by years in groups on the file.

However, it and other variables which have been modified on the public-use file are available through custom retrievals.

- # **Collapsing categories.** Similar to down-scaling, this is applied to categorical (i.e. qualitative) variables. Country of birth is one variable where the detailed categories are collapsed on the file.
- # **Top and bottom coding.** Very high and very low values usually are rare or unique in the population. Such extreme values are replaced with an upper or lower range or value.
- # **Rounding.** Some variables, particularly monetary values, are rounded.
- # **Suppression of characteristics.** In certain cases, combinations of variables such as ethnicity, occupation, family size, number of children, etc., can be problematic. Detailed cross-tabulations were examined to identify such cases, and certain values were suppressed or collapsed.
- # **Subsampling of family characteristics.** To prevent the identification of families by grouping individuals with the same family characteristics, a number of family characteristics are shown for only one member randomly selected from each family. The sample population is therefore reduced for many family variables.

1994**# Addition of “noise” (perturbation).**

Monetary values may have been raised or reduced by unequal amounts and proportions in a random-like fashion (addition of “noise”), while maintaining data integrity for the purpose of producing precise and accurate statistics. This is also true for the person’s age.

Imputed records and variables on the file are not identified as such.

File structure

The framework for structuring the data is a data model in which all information is expressed as variables. The exact definition of each variable is not tied to the way it was collected or to the various processing steps. The variables are attached to the unit to which they most closely refer (whether person, family, job, etc.). However, since they are in a relational database, they can ultimately be crossed in any number of ways.

A relational database structure has been adopted due to the wide content of SLID and the complexity of longitudinal data. A relational database provides great flexibility and efficiency for manipulating and storing information. The master database, accessible only to those within Statistics Canada, is a relational database. Public-use microdata files are an extract of the internal master database. For the first few public-use files, flat files have been created from the master file. Once a few years of data are available, all public-use files will be in a relational database form.

Regardless of the number of years covered in each microdata file, the data from all years of a panel look as if they were collected at a single time, namely, at the end of the latest reference year.

During collection, the data are collected in separate annual files. However, rather than present the output data this way, the structure of the files and the variables are such that the data can be readily merged across years to recreate seamless time spells.

Users stand to benefit from the long-term view taken during SLID's design stage. By envisaging the full potential of the SLID database at the outset, it is anticipated that no analytical possibilities will be precluded. Although the development of the data model implied a longer development time for the first output files, later file releases (by the third, fourth or fifth year) should be released faster than would otherwise be the case.

More information on the data model approach is provided in Working Paper No. 95-16, *Modelling Data Files for Longitudinal Surveys*.

Derived variables

Due to the large number of derived variables in SLID, the emphasis for user documentation is on variable descriptions rather than survey questions. Survey questions are designed to accommodate data collection and are often not that useful in isolation as analytical variables. For example, to collect one analytical variable, there may be several different questions addressed to various subgroups, by means of "branching" in the questionnaire.

In addition to the necessity of smoothing out question wordings and branching, it has been possible to derive a great deal of information in

1994

SLID. Derived variables reduce the amount of further “processing” required by users to create useful variables. The time dimension of longitudinal analysis presents a considerable challenge by itself, so any simplification of the information prior to applying longitudinal analysis is likely to be helpful. Users can, of course, compute their own additional variables using existing variables, or redefine some variables that are already on the file.

All variables are described in the data dictionary. All processing information not shown in the Guide or working papers is available on request.

Time dimension

All variables are specified as either fixed (a single value exists for the whole panel), annual (a value is required for each year), or spell (the number of values is the same as the number of spells in the panel).

However, many variables also serve to convey the elaborate time *sequences* of states and events. A variety of ways of conveying time have been used in SLID. Start and end dates may be given. Alternatively, a time *vector* of variables, either monthly or weekly, shows what the status was in each month, or in each week. A few other variables give the total number of months or weeks of a state (in a year), irrespective of the number of spells; others give the number of spells irrespective of their durations. The following examples show how time is described in the variables.

TABLE 4. Time-related variables

Time indicator	Example (approximate variable name)
Date	Date of last move (year/month/day)
Year	Year last diploma (non-university)
Annual status	School grade in reference year
Monthly status	Months looked for work in jobless spell
Weekly status (vector)	Weekly labour force status
Start date	Start date of marital state
End date	End date of marital state
Ended	Marital state ended (yes/no)
Duration	Duration of absence from work (weeks)
Weeks per year	Number of weeks employed in reference year
Spells/events per year	Number of absences from this job in reference year
Total number of spells/events	Number of absences from this job
Ever	Ever enrolled in university (yes/no)
Change flag	Same family as last year (yes/no)

1994

Replacement variables on the public-use file

As described in Chapter 8, “Confidentiality of Public-use Microdata”, some modification of data is required on the public-use files to suppress detail that carries a disclosure risk. The various types of modifications are described in that chapter. The variable descriptions in the data dictionary contain notes to identify suppressed variables and those that are subsampled (one person per economic family).

Nevertheless, in many cases, the replacement variables (those with less detail than the suppressed variable) are included on the public-use file and are sufficient for simulating an exploration of the full SLID content. They may serve to approximate the desired results. By doing such exploratory work with the public-use file first, users can minimize the size and costs of the custom outputs they ultimately need to purchase.

10**THEMATIC DESCRIPTION
OF CONTENT**

This chapter provides information on concepts and definitions, data uses and limitations for the survey's main variables. The order of presentation is based on the survey's *content themes*, which are groups of related variables (see chart on next page). The microdata person file layout and the data dictionary also follow the same structure. There are 14 themes in all, grouped into four broad categories:

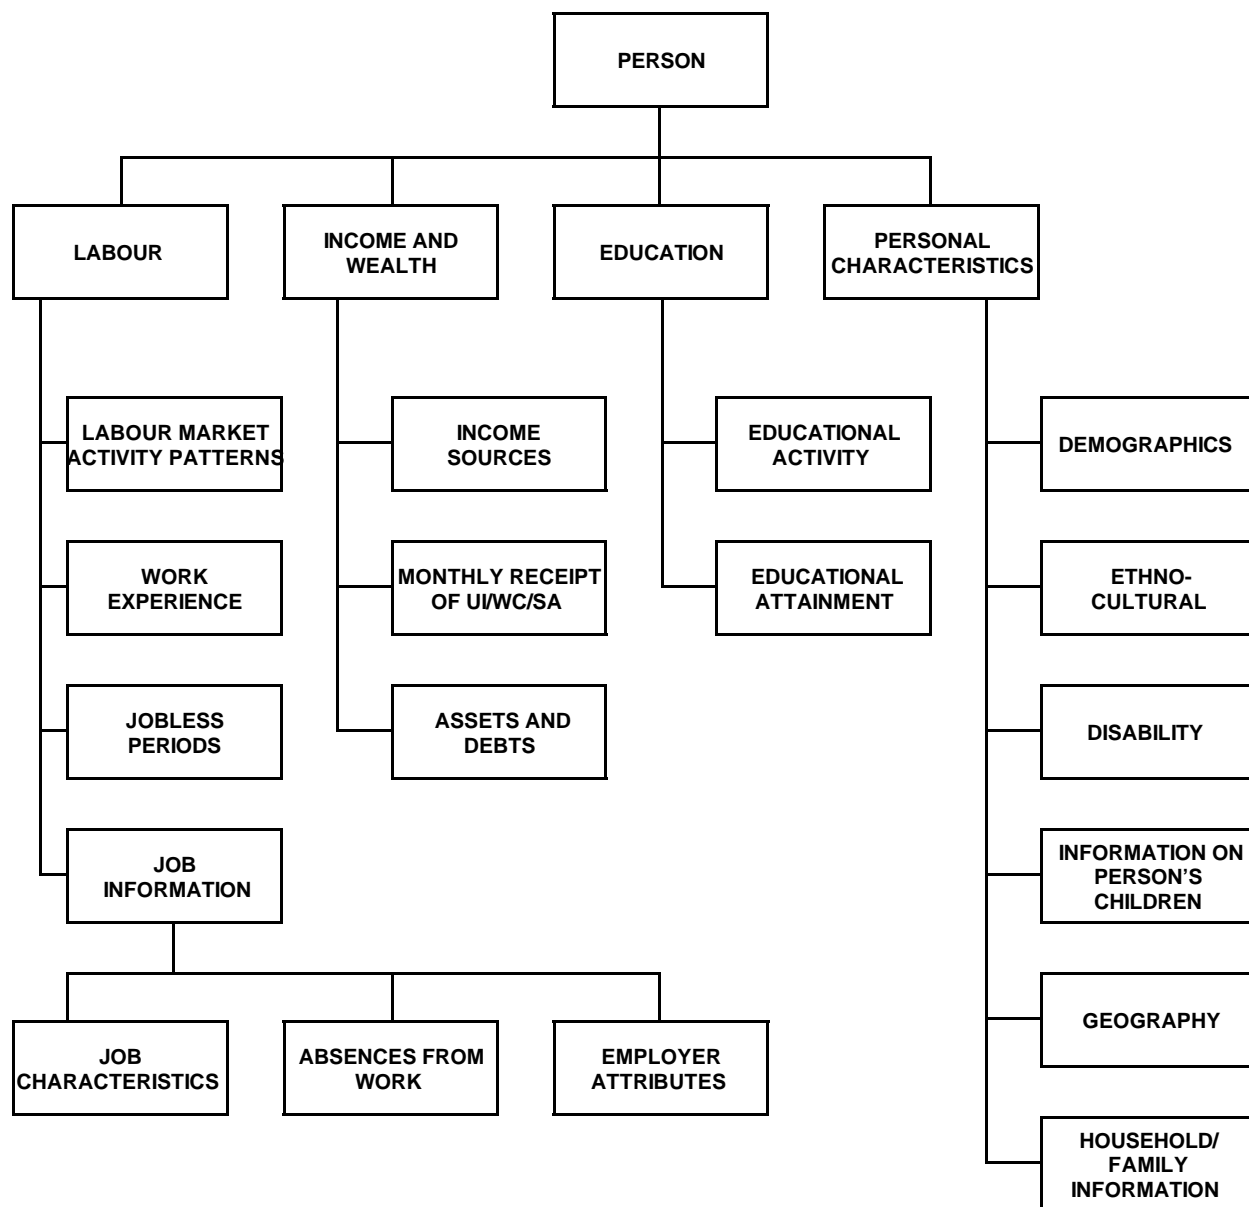

personal characteristics

education

income

labour

ORGANIZATION OF CONTENT

NOTE: Assets and debts may be collected once or twice over the life of a panel. At this time, there are no definite plans for collecting these data.

1994

SAMPLE CONTROL

In addition to content variables, there are several variables which are necessary to use the file:

Identifiers

A SLID respondent keeps the same identifier for the duration of the panel. On the external file, the person ID is replaced with a random ID that cannot be used to regroup individuals into their original families. Family and household identifiers, available on the internal file, are shared by all persons living together on December 31 of a given reference year. Thus, a person has a household and family ID for every year in the survey.

Weights

For more information on the weights, refer to Chapter 5, “Weights”.

Response Codes

The respondent status variable is assigned annually to identify various subgroups within the sample. In particular, this variable may be used to identify longitudinal respondents who have died, entered institutions or moved out of the ten Canadian provinces.

The annual household response code shows whether complete information was obtained for all household members, or whether the information for some members was missing. This variable is based on the response codes for individual members of the household, which are present on the internal files.

The stratum number and replicate ID are on the internal file for microdata users who wish to calculate exact variances themselves (using a technique such as *jackknifing*).

PERSONAL CHARACTERISTICS

Theme 1.

Demographics

Year of birth, age and sex

Year of birth is collected in single years. By subtracting the year of birth from the reference year, one can calculate a person's age on December 31 each year. Age in single years is provided on the public-use file. For confidentiality reasons, the age values available externally have been modified. In transforming the values, care was taken to minimize the impact for analysts.

1994

Marital status

Six marital states are distinguished: married, common-law, separated, divorced, widowed, and single (never married). A seventh category — separated from a common-law union — is available on request. (These cases are coded as *separated* in the 6-category typology.) The survey identifies:

- # the marital state at the time of the first interview;
- # the date that marital state began and its duration (except for the state *single*, where both the start date and the duration are not applicable);
- # the date of first marriage, from which age at first marriage is derived; and
- # whether or not the person has been married more than once.

With this information, SLID reconstructs a near-complete history of marital states or spells for each respondent, as a starting point for recording the changes that will occur over the six-year life of the panel. These states are presented in chronological order and labelled *State 1*, *State 2*, and so on. For confidentiality reasons, start and end year (rather than full dates) are given on the external file.

State 1 is always single, and is included for completeness. If the person has never married, and was not living common-law at the time of the preliminary interview, State 1 will be *unended* and there will be only one state on record.

State 2 will have a start date equal to the date of first marriage. Or, if the person was in a common-law relationship at the time of the preliminary interview and had never married, State 2 will be common-law and the start date will be the date that relationship began.

State 3 and subsequent states can be anything but single.

Some notes on using marital history data:

- # There may be implied states between the states recorded in the survey. For example, a person may be recorded as passing from married to divorced, but there was in fact a spell of separation in between. A variable showing the duration of the “de facto” marital state ignores such changes in the **legal** status. For example, if the marital status for a given state is “divorced”, the duration will be the time since separation.
- # Common-law relationships that ended prior to the start-up of the panel are not captured.
- # Some states are missing a start or end date, because of the way the questions were asked (that is, it was necessary to limit the amount of detail collected on marital changes).

1994

Theme 2. Ethnocultural characteristics

The ethnocultural questions are similar to those of the 1991 Census. For questions other than those on mother tongue and immigrant status, the main purpose is to identify employment equity target groups.

Mother tongue. The question defines mother tongue as “the language that (the respondent) first learned at home in childhood and still understands”. On the external file, available categories are English, French, and Other. The variable was coded using the 1991 Census list (about 190 codes). The sample is too small to provide reliable estimates at this level of detail; however, it provides maximum flexibility for deriving user-defined groupings. A typology of 14 categories is also available on the internal file.

Country of birth. Again, country of birth was coded using the 1991 Census of Canada list (about 240 codes). A summary variable with 5 categories is included on the external file, i.e. Canada, US, Europe, Asia, and other. A variable with 18 categories is on the internal file, along with the most detailed list.

Immigrant status, age at immigration, and period of immigration.

Ethnic background. The full code list has about 160 categories. The ethnic background question allows for up to five responses. The variables provided on the external file are all in the form of Yes/No flags. They are based on the following question: “Canadians come from many

ethnic, cultural and racial backgrounds. For example, English, French, North American Indian, Chinese, Black, Filipino or Lebanese. What is (respondent)'s background?"

Parents' education. The general educational attainment of the person's mother and the person's father regardless of whether or not the person is still living with them. These variables can be useful for studying intergenerational mobility. They are based on the following question: "What was the highest level of education completed by (respondent)'s father? Was it elementary school, some high school, completed high school, non-university certificate or diploma, bachelor's degree, university degree above bachelor's?" An analogous question is asked with respect to the respondent's mother.

Target groups for Employment Equity purposes

SLID identifies visible minorities and Aboriginal peoples (living off-Reserve, in the ten provinces). Because these groups represent fairly small proportions of the total Canadian population, their absolute numbers in the SLID sample are small. Also, the sample is designed for maximizing the quality of labour characteristics rather than ethnocultural characteristics. Therefore, analyses using cross-tabulations of characteristics should generally be done at the Canada level only.

1994

Nevertheless, after the size and design of the SLID sample are taken into account, the estimates for visible minorities and Aboriginal peoples are remarkably similar to those of the 1991 Census.¹⁰ Note also that certain differences in the ethnicity question compared to the Census reflect SLID's computer-assisted interviewing method as compared to the census paper-and-pencil questionnaire.

Visible minority status. Yes/no and group. Specific visible minority categories are defined on the SLID database and are available on request subject to sample sizes. Questions on ethnic background, mother tongue, and country of birth, in that order, identify people belonging to a visible minority using a procedure developed by the Interdepartmental Working Group on Employment Equity Data, for the 1991 Census of Population.¹¹

Visible minority background. Responses to the ethnic origin question are flagged if they correspond to one of the origins identified as visible minority groups.

10. See "SLID Employment Equity Data", *Dynamics of Labour and Income: 1994 Report*, Catalogue 75-201. Also printed in Working Paper No. 95-08, *The Survey of Labour and Income Dynamics: Visible minorities and aboriginal peoples*.

11. The procedure is described in *Women, Visible Minorities, Aboriginal Peoples and Persons with Disabilities: The 1991 Employment Equity Definitions*, Interdepartmental Working Group on Employment Equity Data, Ottawa, 1993.

Aboriginal target group status. The question on Aboriginal peoples in Canada, taken from the 1991 Census, serves to identify a few Aboriginal persons who may not have reported an aboriginal ethnic background. The question is worded, “Is (respondent) a treaty Indian or a Registered Indian as defined by the Indian Act of Canada?”.

Aboriginal background. Responses to the ethnic origin question are flagged if they correspond to one of the origins identified as aboriginal groups.

For more information, see SLID Working Papers No. 94-18, *SLID Derived Variables: Demographic, Cultural and Geographic*, and No. 95-01, *SLID Coding Structure: Mother Tongue, Country of Birth and Ethnic Background*.

Theme 3. Activity limitations

The purpose of the disability questions is not to determine the nature of the condition so much as the impact on activities, particularly on work activities.

A few screening questions on disability ask about any long-term condition that limits the person at home, at school or in other activities, or in the kind or amount of activity he/she can do at work. As a final probe, the person is asked whether he/she has any long-term disabilities or handicaps. The screening questions are similar to questions in the 1991 Census.

1994

After it is determined whether the person has such a condition, the following information is obtained:

- # Year/age when the condition started, the duration, and whether it was present at birth.
- # Does the condition completely prevent the person from working at a job or business or from looking for work.
- # For those who can work, does the condition make it difficult to change jobs or get a better job.
- # Whether the person was satisfied with the number of weeks worked or wanted to work more, or less; and if the volume of work was not satisfactory, whether this was due to the condition.

Under the family and household characteristics theme

- # Number of family members aged 16 and over with a condition or disability, and number of family members aged 16-69 prevented from working due to a condition or disability.

With regard to all the variables dealing with activity limitations, it is important to note that, since the questions are asked each year, a person could report having a condition or disability one year (even a long-term one), but not the following year.

Theme 4. Information on person's children

In the preliminary interview, women are asked about children they have had by birth and any other children they have adopted or raised. Also available is the year or age of the respondent when her first child was born. This information is collected in the survey because it has an effect on women's labour market involvement and work histories. Starting with Panel 2, this information is being asked of men also, because it is a potentially useful adjunct to the data on children in the current household, that is, an indication of possible family commitments in relation to children living in other households.

Theme 5. Geography

The precise reference date for geographical information is December 31 of a given year.

Geographic area

The person's place of residence at the end of each year is coded to various levels of detail using Statistics Canada geographical codes. Thus, while limited geographical information is available on the external file, finer levels of geographic detail are available through custom requests, subject to sample size and confidentiality constraints. (The second panel of SLID, which will double the sample size, will provide greater flexibility in defining geographical areas.) Codes are assigned at the following levels: economic region, census metropolitan area or census agglomeration, federal

1994

electoral district, enumeration area, census division, census subdivision, urban area, and employment insurance region.

The variables on urban/rural areas and size of area of residence relate to the population concentration in the area where the respondent lives. The information is interesting in its own right, but it is also used to determine the appropriate low income cut-off, which varies by size of area of residence. SLID originally considered using the census method for assigning size of area of residence; however, this would have contributed to a discrepancy in income estimates between SLID and SCF (documented in SLID Working Paper No. 96-07). An adjusted size of area of residence is used which conforms to the definition used by SCF as closely as possible. The information is suppressed on the public use file because in some provinces it is possible to identify the respondent's city.

The internal SLID file also contains the postal code of the mailing address reported by the respondent. The postal code serves as the "building block" for coding the geographic area corresponding to that person's residence.

The location of the postal code is represented by a point expressed in latitude and longitude, also present on the internal file. This may be used to estimate distance moved for persons who have a different residence from the previous year, using the following formula:

$$D = 111,195 * \arccos [\sin (\text{lat1}) * \sin (\text{lat2}) + \cos (\text{lat1}) * \cos (\text{lat2}) * \cos (\text{long1} - \text{long2})]$$

where (lat1, long1) and (lat2, long2) are the latitude and longitude of the two points and D is the resulting distance between them in metres. The method calculates the distance along a “great circle arc”, which gives the shortest surface distance between any two points on a sphere (Source: Robinson, Sale, and Morrison. *Elements of Cartography*, 4th edition. New York: Wiley, 1978).

For more information about definitions of census geographical areas, refer to *1991 Census Handbook*, Catalogue 92-305, or *1991 Census Dictionary*, Catalogue 92-301.

SLID Working Paper No. 97-09 provides a more complete explanation of the use of geography in SLID.

Family dynamics and geographical mobility

Several variables are designed to capture geographical mobility. A simple, everyday event like two people moving in together can be remarkably difficult to convey in a set of variables. If both lived alone previously, then two households have merged to form one. If both lived with other people previously, then two households have split to form three. The other households involved have been modified by this event, in that they have lost a

1994

member. There may be a geographical move involved for both people, or only for one of them. If both moved, the move dates may be the same or staggered.

Thus the description of this seemingly simple event requires variables relating to geographical mobility, family or household composition, and dates. The following are among the variables that can be used to study changes in living arrangements during the year:

- # Did the individual move during the reference year and, if so, the date and reason (for the most recent move if there was more than one); did the whole household move intact;
- # Was the person living with the same family members and same household members at the end of the year as he/she had been one year earlier, i.e. were the family and household membership unchanged;
- # Did the person's family at the end of the year include a new person — someone who was not present at the end of the previous year.

All of these measures refer to the individual's family circumstances, because the family is not a unit that necessarily stays constant through time.

For data users accustomed to using the family as a unit of analysis, this change in perspective can take some adjustment. An analysis of family change was

published in the April 1996 issue of the survey's quarterly newsletter, *Dynamics* (Product number 75-002-XPB, Vol. 5, No.1), and offers some illustrations of the types of data outlined above. As noted in the study:

“The economic family refers to related individuals sharing a dwelling at a point in time. In this way, the family is a static concept. In everyday terms, many of us do not think of families as static. We have notions of when a family changes “a bit” and when it ceases to exist, but it would be very difficult to convert these notions into a rigorous measurement approach. For analysing change within families, the solution is to keep the focus on the individual and describe family events from the standpoint of each individual in the family.”

Due to the impossibility of defining a longitudinal family or household, SLID suggests using an “attributional” approach, which attributes to each individual the characteristics of the family in which he or she lives.

For more information on the limitations of analyzing longitudinal family data, and on the approach used by SLID, consult SLID Working Papers No. 94-06, *SLID Household and Family Variables*, and No. 96-11, *Family Data from the Survey of Labour and Income Dynamics: 1996 Status*.

1994

Theme 6. Family and household characteristics

This theme covers most household and family characteristics on the file. Information on children the person has given birth to, adopted or raised is covered under a separate theme (*Information on person's children*). Several variables describe the family or household composition changes and geographical changes of the person's living arrangements. They are covered by the *Geography* theme.

Family data always refer to the economic family. This is a broad definition of family, including all persons sharing a dwelling and related by blood, marriage, common-law or adoption. The family is defined as of the end of each year. According to the strict definition of the term, an economic family must have at least two persons. SLID allows one person families, but users may remove them from analysis if they wish. Note that the individuals who make up a person's family may change from year to year.

This summary family information is presented as an attribute of the person. On the external files, many of the family characteristics are shown only for a subsample, namely one person randomly selected per economic family (see Chapter 5, "Weights"). However, analysis can be done on the full SLID sample by asking for special outputs which are screened for confidentiality before being passed to the client.

Household size and type

SLID does not include many variables at the household level; in general, the emphasis is placed on the economic family. Most households in fact include a single economic family but for those who are interested in non-family households, a few household variables are included:

- # Size (number of persons) and composition, i.e. one individual, two or more, and whether two or more economic families are present.
- # Type of dwelling (single detached house, apartment, etc.) and ownership status of the dwelling.

Family size and type

- # Size, composition (seven categories), number of generations in the family, whether it is a step family, and ages of the youngest and oldest family members. The number of family members in each age group has also been derived, one variable for each age group. For future files, the step family type may also be available, i.e. a summary of the child/parent relationships in the family including step relationships.
- # **Family equivalence scale.** This variable reflects the size and composition of a family for the purposes of comparing family incomes (when not using low-income cut-offs, which already take into account family size and composition).

1994

Two people with identical family incomes may be in very different financial circumstances because their family size and structure differ. The family equivalence scale allows one to compare family income by incorporating this information. There is no agreement among “experts” on the optimal equivalence scale. SLID includes two scales: one used by the OECD (Organization for Economic Co-operation and Development) and the other used by Statistics Canada for the derivation of Low Income Measures (LIMs). To incorporate an equivalence scale in a comparison of family incomes, divide the family income by the equivalence scale.

Income sources (of the economic family)

Several income sources, along with total income and income taxes payable, are provided for the economic family. That is, these variables add up the incomes of the individuals who were part of the same family on December 31 of the reference year. On the external files, some rounding and perturbation is done for confidentiality reasons, but most of these family income variables are shown for the full sample, rather than just one person per family.

Also available at the family level are a series of variables relating to low income status. These are shown for both before-tax and after-tax income. See the “Income” theme for more information.

Labour characteristics (of the economic family)

There are a series of variables that provide summary labour market and other information for the economic family as a whole:

Labour market activity patterns. Number of family members employed/unemployed, by week and at any time in the reference year; number of weeks of employment and unemployment for all family members during the year; number of family members in full-year, full-time jobs; number of family members self-employed during the year; and number of person-jobs held by all family members during the year.

Education/Ethnocultural. School attendance, e.g. number of members aged 16 and over attending school full-time or part-time during the year, and the number of months of attendance this represents. The attainment levels of the person's mother and the person's father are available under the "Ethnocultural" theme.

Disability. Number of family members aged 16 and over with a condition or disability and number of family members aged 16-69 who are prevented from working due to a health condition or disability.

Receipt of employment insurance benefits, social assistance and workers' compensation benefits. For each type, whether or not anyone

1994

in the family received benefits during the year, and the months during which any family member received them. Particularly for social assistance, the data are best analysed at the family level, because who in the family reports the income is a somewhat arbitrary matter.

LABOUR

Theme 7. Labour market activity patterns

This theme summarizes labour market activities for the year as a whole rather than looking at distinct jobs or spells. The variables are annual (that is, one observation for the year as a whole) except where specified as monthly or weekly. These variables are all based on the more detailed spell data and job characteristics, and there are often corresponding job-specific or spell-specific variables listed in other themes.

Summary employment variables

There are several variables that summarize the total volume of work done at all jobs that year, based on the detailed information collected on a job-by-job basis. The following are examples:

Number of jobs held in each week of the year.

This provides a week-by-week count of the number of jobs held. It can be used, for example, to distinguish multiple jobholders from job

changers. For example, a person with two jobs, where the jobs overlap for more than four weeks or so, might be defined as a multiple jobholder. It is probably best to consider short periods of overlap as a gradual job change rather than true multiple jobholding, because this information is based on job start and end dates which are sometimes approximate.

Number of jobs held in the year. In addition, there are variables showing the number of paid worker jobs in the year, and whether the person was self-employed at any point in the year.

Months in which some work was done. This refers to months where the person held one or more jobs, and was not absent or on layoff from all of them. There is a distinct variable for each month of the year. For example, if a multiple jobholder with two jobs in February was absent all month from both due to illness, this variable would show the person as not working in February.

Total (usual) hours at all jobs in the year. This annual variable reflects the work schedule information of all jobs held in the year. In addition, there are corresponding monthly variables that will sum to the annual total.

Total hours paid in the year. This is similar to the previous variable, except that it excludes unpaid absences.

1994

Labour force status

Although the same basic concepts on labour force status have been used as for the Labour Force Survey (LFS), which produces the monthly official figures on employment and unemployment, a few new measures related to labour force status exist in SLID. For those that are comparable with the LFS, certain differences in results are likely to occur owing to the longitudinal and retrospective nature of SLID. Labour force status is inherently difficult to measure in a retrospective setting. For example, respondents may not recall their job search precisely. More discussion of this is provided in Working Papers No. 92-04, *The Measurement of Job Search and Unemployment in a Retrospective Setting* and No. 92-06, *Labour Force Classification in SLID*.

In SLID, as in the LFS, labour force status can take one of three values: employed, unemployed, or not in the labour force. The definitions in SLID are as follows:

- # **Employed** — worked at any time during the week or absent from a job for a reason other than layoff;
- # **Unemployed** — not employed during the week and looked for work at some time during the month OR absent from a job due to layoff;

Not in the labour force — not employed or unemployed during the week.

A person may hold a job but not be employed during a given week, if he or she is on temporary or seasonal layoff and expects to return. Other absences do not affect the person's status as employed, whether the absence is paid or unpaid. Questions on work absences are addressed to paid workers only, so that the self-employed and unpaid family workers are classified as employed as long as they hold that job.

The following variables unique to SLID are based on labour force status concepts:

Weekly labour force status. This is a vector of 53 observations — one observation for each week of the year, including the part-weeks at the beginning and end of the year. Table 5 shows the exact start and end dates of the weeks for the reference years released to date.

If you wish to program the conversion of week numbers to dates, the algorithm which follows the tables may be used.

Users should note that the labour force status in Week 53 is not necessarily the status at the end of the year. For example, if a person was employed at the beginning of the week, but unemployed the rest of the week, he/she would be classified as employed for that week.

1994

Number of weeks employed during the year. This is a value between 1 and 53, based on all jobs held during the year. It is derived from the weekly labour force status vector. There are similar variables for total weeks unemployed and total weeks not in the labour force.

Annual labour force status. An annual summary of all the labour force states experienced by the person during the year (comparable to a variable found in the earlier Labour Market Activity Survey). The possible values are:

- < Employed all year;
- < Unemployed all year;
- < Not in the labour force all year;
- < Employed part-year, unemployed part-year;
- < Employed part-year, not in labour force;
part-yearUnemployed part-year, not in labour
force part-year;
- < Employed, unemployed and not in labour force
during year.

For a more detailed examination of SLID labour force status, including a comparison with the LFS, see SLID Working Paper 97-10, *Labour Force Classification in SLID and LFS*.

TABLE 5. Labour force weeks, 1993 and 1994

All weeks are defined as seven consecutive days starting with Sunday and ending on Saturday, with the possible exception of weeks 1 and 53. Week 1 is the period starting with January 1 and ending on the first Saturday of the year. Week 53 is the period starting with the last Sunday of the year and ending on December 31. For weeks crossing months (for users wishing to aggregate weeks into months), the desired month is the one in which the majority of the week falls (i.e. four or more days).

Number	Week in 1993	Week in 1994
1	January 1 to 2 (Friday to Saturday)	January 1 (Saturday)
2	January 3 to 9 (Sunday to Saturday)	January 2 to 8 (Sunday to Saturday)
3	January 10 to 16	January 9 to 15
4	January 17 to 23	January 16 to 22
5	January 24 to 30	January 23 to 29
6	January 31 to February 6	January 30 to February 5
7	February 7 to 13	February 6 to 12
8	February 14 to 20	February 13 to 19
9	February 21 to 27	February 20 to 26
10	February 28 to March 6	February 27 to March 5
11	March 7 to 13	March 6 to 12
12	March 14 to 20	March 13 to 19
13	March 21 to 27	March 20 to 26
14	March 28 to April 3	March 27 to April 2
15	April 4 to 10	April 3 to 9
16	April 11 to 17	April 10 to 16
17	April 18 to 24	April 17 to 23
18	April 25 to May 1	April 24 to April 30
19	May 2 to 8	May 1 to 7
20	May 9 to 15	May 8 to 14
21	May 16 to 22	May 15 to 21

Jobless spells and absences from work

A jobless spell is a period in which the respondent does not have an employer. The spells are derived from the start and end dates of jobs held during the year, that is, they correspond to the “gaps” between these employment dates. As the survey collects information on up to six employers, a person can theoretically have up to seven jobless spells on record during the year. For each jobless spell, a number of characteristics are collected — see Theme 9. Under “Labour Market Activity Patterns”, there is a summary variable providing the number of jobless spells in the year.

Information on work absences of one week or longer is collected on an employer-by-employer basis. Again, a series of characteristics are collected on each such absence — see Theme 10. As with jobless spells, summary variables are available under “Labour Market Activity Patterns”.

Not counted in these summary variables are absences from one job while the person worked at a second job (i.e. with a second employer); a simultaneous absence from all jobs held at the time is counted as one absence spell.

There is a flag indicating whether or not any compensation (employment insurance benefits, workers’ compensation or social assistance) was received during the year. However, compensation is not collected in the context of a jobless spell or job absence.

1994

Wages

There are two main variables that summarize wages and salaries across jobs. The first is the “composite hourly wage rate”: the average wage of all paid worker jobs held by the person during the year. For a person with two or more jobs, an average wage rate is calculated, weighted according to the number of hours worked at each job during the year. The measure can be interpreted as the average rate for each hour the person worked in the year, excluding any self-employment.

The second variable is “wages and salaries at all jobs”. This is the total earnings from all paid worker jobs held during the year. It is based on wage rate and hours information collected during the labour interview. The wages and salaries variable in the Income theme, which is obtained in the context of the income interview, is in principle quite similar. The main conceptual difference is that the earnings of owners of incorporated businesses are excluded from the labour-based variable (since they are self-employed, wages are not collected), but they may be reported in the income-based variable. Beyond this conceptual difference, there are reporting differences, which are sometimes substantial. In future years, some reconciliation may be undertaken but the initial decision was taken to not force consistency. This is really the first time a direct comparison can be made between the two long-established approaches for collecting wages and salaries data and some time is needed to develop an appropriate reconciliation approach.

Determining start and end dates for a given week

Weeks are defined in the following manner which ensures that every year will have exactly 53 weeks. Weeks do not cross calendar years, although they can cross months within a year. All weeks are defined as seven consecutive days starting with Sunday and ending on Saturday, with the possible exception of weeks 1 and 53. Week 1 is the period starting with January 1 and ending on the first Saturday of the year. Week 53 is the period starting with the last Sunday of the year and ending on December 31. (There is one exception: leap years where January 1 falls on a Saturday. This will happen in the year 2000. In this case, week 53 will have 8 days and will go from Sunday to Sunday.)

Step 1: Represent each day of the week by a numerical code: Sunday = 1, ..., Saturday = 7.

Step 2: Identify the day of the week on which January 1 falls (see table below).

Step 3: Determine numerical values for start date and end date

- If WEEK = 1, then
Start date = January 1
Numerical end date = 8 - (day of the week on which January 1 falls)
- If WEEK is in the range from 2 to 52 then
Numerical start date = Jan. 1 + (WEEK - 2) * 7 + (numerical end date of Week 1)
Numerical end date = Start date + 6
- If WEEK = 53, then
Numerical start date is calculated in the same way as for weeks 2 to 52
End date = December 31

Step 4: Convert numerical dates to actual dates. The numerical date is a sequential numbering of dates in a year with January 1 = 1, January 2 = 2, and so on.

Day of week of January 1, for 1993 to 2004 (to end of Panel 2)YearJanuary 1 falls on:YearJanuary			
1993	Friday	1999	Friday
1994	Saturday	2000	Saturday
1995	Sunday	2001	Monday
1996	Monday	2002	Tuesday
1997	Wednesday	2003	Wednesday
1998	Thursday	2004	Thursday

1994

Job search

Annual summary variables include whether the person was looking for work at the end of the year (for persons without a job at year end); and a monthly vector variable on job search.

Family (labour market) variables

Under Theme 6, there are several variables providing summaries at the economic family level) for example, number of family members employed and number unemployed by week; the number of weeks of employment and unemployment for all family members during the year; and the number of family members in full-year, full-time jobs during the year. In future, the number of person-jobs held by all family members during the year may also be derived.

Theme 8. Work experience

These variables are a first in household surveys at Statistics Canada. SLID aims to get an approximate measure of total paid work experience by asking respondents to recall their total work history in broad terms, using a series of questions.

To simplify the interview questions, work history is defined as beginning with the respondent's first full-time job, excluding summer jobs while in school. The main variable is the *number of years of work experience in full-year, full-time equivalents*.

For most purposes, this is the only variable users will need to use. It takes into account years worked full-year or part-year and full-time or part-time work schedules, but collapses the years defined these different ways into a single measure, as explained below. However, users may value part-time and part-year work differently if they prefer and construct their own work experience summary variable.

Scenario	Full-year, full-time equivalent
Full-year, full-time (6 months or more, 30 hours per week or more)	1
Full-year, part-time (6 months or more, under 30 hours per week)	0.5
Full-year, some full-time/ some part-time	0.5
Part-year (less than 6 months), whether full-time or part-time	0.25
Year with no work	0

1994

For example, if someone had first started working full time 15 years ago and since then had worked 6 years full time, for at least 6 months each year, plus 5 years full time but less than 6 months each year, plus 4 years part time for at least 6 months each year, he or she would have

$$(6 \times 1 + 5 \times 0.25 + 4 \times 0.5) = 9.25 \text{ years of work experience.}$$

The work experience variables are updated for each reference year using information on recent paid work activity. The status of work done in each month of the year is assessed (no work done, part-time or full-time work) and this is used to determine which of the categories above best describes the work activity that year.

Starting with the 1996 collection, a second, augmented measure of experience will be attempted which includes the part-time experience of people who never worked full time and, for people who have worked full time, their previous part-time experience. (Jobs while in school are excluded in both added components).

For more information, see “The work experience of Canadians: A first look”, in *Dynamics of Labour and Income: 1994 Report*, Statistics Canada.

Theme 9.

Jobless periods

A jobless period or spell is one in which the person has no attachment to any employer. Seasonal layoff or any other type of layoff where the person expects to return to work with the employer are treated as an absence from work. Note, therefore, the distinction between the terms “jobless” and “unemployed”, and the fact that jobless periods cannot be linked in any way to specific jobs.

In addition to the total number of jobless spells for the person during the year (see Theme 7, “Labour Market Activity Patterns”), these characteristics are collected on each spell:

- # Dates and durations. Derived from the start and end dates of jobs held during the year.
- # Whether or not the person looked for work during the jobless spell (the *method* of job searching is not collected, as it is in the Labour Force Survey).
- # A vector indicating in which months during the jobless spell the person looked for work.
- # If the person did not look, did he/she want a job, and what was the reason for not looking. This information can be used to analyse discouragement, the “near labour force” or the interplay of family responsibilities and paid labour market activity. As well, a variable under Labour Market Activity Patterns shows the

1994

months in the year when the person looked for a job, and if the person was looking for a job at the end of the year.

Theme 10.

Job characteristics

Definition of a job

A job exists when a person is working, or is absent but expects to resume work. The job therefore represents a period during which a worker is continuously attached to an employer. This period of attachment may contain work absences, including spells of temporary layoff.

In 1993, the start and end dates, employer names and a limited selection of other variables were collected for up to six jobs. Very detailed characteristics were captured for a maximum of three jobs) rather than six) for fear of overburdening the respondent. However the number of people with more than three jobs in a year is so low that, from 1994 onward, the same characteristics have been collected for all jobs. Although this will not yield much more data, it removes an unnecessary complexity.

Users of data from the Labour Market Activity Survey (LMAS) should be aware that the LMAS defined jobs more narrowly. Specifically, LMAS defined a job as being a period of continuous attachment to an employer during which the wage rate or duties remained constant, but other

characteristics could change. If both wage and duties changed, a new job was deemed to have started.

The reason for deviating from the LMAS definition was to provide greater flexibility in defining a “job”. Users who wish to can derive a definition similar to the one used in LMAS, by identifying cases in SLID where the person’s wages and duties changed during the year. But other definitions of a job are possible, using a mix of occupation, wage rate, work schedule, supervisory and managerial responsibilities, jobholding dates and absence information as criteria for a job change. Certain dichotomous variables indicating the occurrence of a change make this easier.

No “main job” in SLID

The ordering of the first, second and third job and so on simply reflects the order in which the respondent reported jobs to the interviewer. Unlike the Labour Force Survey, SLID does not identify a “main job”. Users who wish to select a main job have several options. For example, one could select the job with:

- # the greatest number of hours worked over the year;

- # the highest average weekly hours in a given month;

1994

the highest wage rate;

the highest annual earnings;

the longest duration.

It is suggested that users avoid the need to define a main job unless it is crucial to the analysis. Using the job as the unit of analysis rather than the person would result in using data for all jobs.

Dates and duration

How the job was found and the date the job was offered. For the time between the date a job was offered and the job start date, the person is classified as unemployed, regardless of job search (if not working at another job). This helps to offset the underestimation of unemployment that can occur in retrospective surveys because of the difficulty of recalling job search after long periods. It is also roughly comparable to the treatment of future starts in the LFS.

Also present are job start and end dates, job ID, flag to indicate if job has ended, duration of job (months), number of months worked and number of absences. There are also two employer continuity variables: the date first worked for this employer, and a flag indicating whether or not attachment to this employer has been continuous since the person first started working for the employer.

Reason why work came to an end (reason for the job separation). Note that each spell of attachment may contain periods of absences or spells of temporary layoff. This variable applies to jobs where the attachment to the employer ended. The information is quite detailed) 25 possible reasons in all.

Jobs ending December 31

In some cases the end date for a job will be recorded as December 31. Although this may be a valid value, it may also refer to a job which existed as of the end of that year, but for which no information is available for the following year. This can happen for one of two reasons:

The person is not contacted or is a non-response for a particular labour interview. In such a case, any jobs which were ongoing at the time of the last interview would be terminated, and there would be a one-year gap in data for this person.

The person is not fed back ongoing jobs from the previous interview, and does not report a job that was ongoing. These jobs will be terminated at the end of the last reference year. There are two reasons why feedback would not happen. First, there can be technical problems in collection which prevent either the feedback information

1994

from reaching the interviewer's machine or the program from accessing the feedback information. As time goes on, this problem should decrease in size but it is a significant problem for the first few survey years. The second reason for no feedback is that currently, the feedback information is not transferred to the new household when a person moves. This does not occur for all movers but only for movers who are assigned a new household ID as a result of a household split.

Class of worker

This variable divides jobholders into paid workers (that is, employees), the self-employed and unpaid family workers. The self-employed are further subdivided based on whether or not they are incorporated and on whether or not they have paid help. This variable is important for several reasons. First, some information, such as wages, work absences and managerial responsibilities, are collected only from paid workers. Second, it will be possible to track flows into and out of self-employment. A series of summary variables in Theme 7 (Labour Market Activity Patterns) indicates whether the person held a paid worker job at some time during the year, whether they were self-employed at some time, and so on.

There is also a variable called “recoded class of worker”, which separates government employees from other paid workers, and which adds the owners of incorporated businesses in with employees. (Technically, an incorporated business owner is an employee of his/her corporation. Such a respondent may designate his/her earnings as either wages and salaries, or investment income.) This variable is similar to one available in the Labour Force Survey.

The information provided by the class of worker variables is used to verify against income sources reported in the income interview (e.g. wages and salaries, non-farm self-employment income). For more information on this type of verification, see the “Editing” section of Chapter 7, as well as “Theme 11, Income sources” in Chapter 10.

Work schedule

Months worked at the job. This shows the months in which the respondent did some work at this job, excluding months in which the person was absent (whether paid or unpaid) or on layoff all month. The file has a separate variable for each month.

Average weekly hours by month. This measure of hours worked refers to the hours for which the person is normally paid. It is based on the work

1994

schedule information (see below). Since up to three work schedules are collected for each job, along with start and end dates for each schedule, it is possible for the average weekly hours to change from one month to the next, up to a maximum of two times. This variable approximates the concept of *usual weekly hours* used in the Labour Force Survey. The main difference is that the LFS includes all hours, whether paid or unpaid. In SLID's case, as in LMAS, this variable is used in deriving wage rate and earnings. The emphasis is therefore placed on the hours for which pay is usually received. There is a distinct variable for each month of the year.

Information is collected on up to three schedules per job per year. The approach is to collect the most recent schedule in the year and then, working backwards, collect information on any previous schedules. There is more information collected on the most recent schedules than on previous ones.

*Type of work schedule.* This distinguishes between regular, daytime, rotating shift, etc.; if irregular, the reason for the irregular work schedule is asked. If there is more than one work schedule, the work arrangements information pertains to the most recent schedule. The same applies to the reason for working part time.

- # **Number of work schedules.** Collected for each job and refers to reference year. The schedule information determines the *average weekly hours* at this job, which can vary by month. There is a flag that indicates whether the person's status changes from full-time to part-time or vice versa.
- # **Work at home.** There is a flag to indicate whether or not the person worked any regularly scheduled hours for this job at home and, if so, the number of hours per week worked at home.
- # **Total usual hours.** This variable reflects the work schedule information for this job during the year.
- # **Total hours paid.** This is similar to the previous variable, except that it excludes unpaid absences. This is one of the few variables under the "Labour" theme to be imputed, since it is required for the calculation of job-specific hourly wage rates.

Earnings (paid worker jobs)

- # **Hourly wage rate.** For each paid worker job, a wage rate is reported or derived. The approach, which has been used previously in LMAS and many other household surveys, is to ask the respondent what his or her earnings were, allowing the respondent to choose how to report

1994

by the hour, the week and so on¹². Then, using information on hours worked, the amount is transformed into an hourly rate, if necessary, to facilitate comparisons across all paid worker jobs. Because the response rate is generally somewhat lower for wage information than for other labour information, wage rate is imputed for cases where it is missing.

The main wage rate variable is the “end wage rate”. This is the rate at the end of the year, or the end of the job if the job did not exist at year-end. In addition, for jobs in progress at the beginning of the year, there is also a “start wage rate”, based on information collected in the previous interview. If there is a difference of $\pm 10\%$ between the start and end wage, this is indicated through the variable *wage change in reference year*, and the month of the change is provided.

Table 6 gives information on the legislated minimum wages for all provinces.

Total earnings from this job in the year. This variable is the hourly wage rate multiplied by the hours paid at the job during the year. Unpaid absences are excluded. If the wage rate changes

12. Based on weighted frequency counts from 1993, the most common wage reporting units were: hourly (51% of valid responses) and yearly (31%).

during the year, this change is reflected in the annual earnings amount. Total earnings may be imputed from income data if only one paid worker job was reported.

TABLE 6. Minimum Wage Rates in Canada for Experienced Adult Workers^a, 1993 to 1994

Jurisdiction	Hourly wage
Newfoundland	\$4.75
Prince Edward Island	\$4.75
Nova Scotia	\$5.15
New Brunswick	\$5.00
Quebec	\$5.70 until 1993-09-30 \$5.85 until 1994-09-30 \$6.00
Ontario	\$6.35 until 1994-01-01 \$6.70
Manitoba	\$5.00
Saskatchewan	\$5.35
Alberta	\$5.00
British Columbia	\$5.50 until 1993-03-31 \$6.00
Northwest Territories	\$6.50 \$7.00 ^b
Yukon Territory	\$6.24 until 1994-09-30 \$6.72

(a) Rates for inexperienced and/or young workers, service workers, and manual labourers will be available at a later date.

(b) For areas distant from the N.W.T. highway system.

Overtime

Amounts reported for wages and earnings include commissions, tips, bonuses, and paid overtime where applicable. Paid hours, on the other hand, might or might not include overtime hours,

1994

depending on whether or not the respondent perceives the overtime as part of his/her regular hours. This could, in some cases, lead to an overestimate of hourly wage figures.

Another factor affecting data quality is that there is only a 25% response rate for the question on commissions, tips, bonuses, and paid overtime.

Finally, the issue of unpaid overtime is not addressed by SLID. There is no question specifically dealing with overtime, and although the survey distinguishes between “total usual hours” and “total hours paid”, the difference between these two amounts is more likely to represent items such as unpaid leave rather than overtime.

Occupation

For each job, the occupation at the end of the year or the end of the job is reported — this is the *end occupation*. In addition, for jobs that existed at the beginning of the year, the occupation at the beginning of the year (the *start occupation*) is indicated. There is also a variable that indicates whether the person’s duties changed during the year. This latter variable reflects the respondent’s perception of whether or not a change in duties occurred — it is possible that a change occurred but the occupation code remains the same because the change was not substantial enough to affect the assigned code.

The questions to derive occupation are the same as for the Labour Force Survey, and the same automatic coding procedure is used. The questions concern the kind of work the respondent was doing (e.g. office clerk, factory worker, forestry technician) and his or her most important activities or duties (e.g. filing documents, drying vegetables, forest examiner).

For the first years of data, occupation is coded at the most detailed level of the 1980 Standard Occupational Classification (SOC). This classification has about 500 categories. For most purposes, the SLID sample size will not permit the use of such detailed categories; consequently, this level is suppressed on the public-use files. However, the detailed categories can be regrouped in various ways. By way of illustration, a variety of “collapsed” occupational groupings are provided — all of them based on the detailed categories of the SOC. Brief descriptions are as follows. In future waves, occupational data will be coded to the 1991 SOC. In addition, various occupational typologies may be added.

1994

TABLE 7. Occupational Groupings in SLID

Long variable name	Definition
Start occ in refyr grp 1 End occ in refyr grp 1	21 major groups of the 1980 SOC
Start occ in refyr grp 2 End occ in refyr grp 2	79 minor groups of the 1980 SOC
Start occ in refyr grp 3 End occ in refyr grp 3	The Pineo-Porter-McRoberts socioeconomic classification of occupations) 16 categories ranging from <i>self-employed professionals</i> to <i>farm labourers</i> . This classification labels the occupations of the SOC according to the skills level and management level.
Start occ in refyr grp 4 End occ in refyr grp 4	The collapsed Pineo-Porter-McRoberts classification) 6 categories ranging from Professional/High level management to Unskilled Workers.
Start occ in refyr grp 5 End occ in refyr grp 5	Corresponds to the 50 categories on the LMAS public use microdata file. (Note that this classification more strongly reflects the industrial sector where the job is located, than do the other four.)

Other job characteristics***# Union membership and pension plan coverage.***

Two types of job benefits are collected. The union membership variable identifies persons who are members of a union and also those

covered by a collective agreement. The other variable identifies whether or not the person is covered by a pension plan in connection with the job.

Supervisory/managerial responsibilities. If the person had supervised people directly, the following details are provided, for the end of the year or the end of the job if ended in the year:

- < number of people supervised directly;
- < whether or not respondent had any influence on pay raises or promotions;
- < whether or not respondent was directly responsible for deciding the work of persons supervised;
- < whether or not respondent made decisions about budgets or staffing;
- < whether or not work at this job was perceived by the respondent to be managerial, and if so, the level (top, upper, middle, lower).

Employer attributes

Spells with an employer are the same as job spells. The dates and duration of attachment spells are therefore under the theme Job characteristics, as are the reasons for separations from an employer. Other employer attributes are:

1994

- # Industry group, private sector/public sector.
These are obtained from questions on the name of the employer and the kind of business, industry or service. Currently SLID uses the 1980 Standard Industrial Classification (SIC). Statistics Canada is in the process of making its surveys compatible with the newly established North American Industry Classification System (NAICS). When NAICS has been adopted as the departmental standard, SLID industry data coded according to NAICS will be made available;
- # Number of locations in Canada (one, or more than one), and number of employees at all locations and where the person is working.

This information is collected on up to three employers per year for 1993 data, and up to six for subsequent years.

SLID also identifies returns to a previous employer identified in an earlier interview. For example, if a job ends in one year, and the person is re-hired the next year, it will be identified as a new job (because this was not just an absence). However, there is a unique identifier for each employer, which can be used to determine if the person worked for this employer at some earlier point in the panel. This covers most seasonal jobs with the same employer. A variable under the “Dates and duration” sub-theme indicates whether the attachment with an employer has been continuous since the person first started working for that employer.

Absences from work

Information is collected on absences of one week or longer, excluding paid vacation. Any absence from work that extends into a third calendar year is instead considered a jobless spell.

Variables on absences from work cover “paid workers”, i.e. they do not cover the self-employed and unpaid family workers (as identified by the “class of worker” variable).

The total number of absences from each job during the year is recorded. As well, detailed information is collected for up to two absences from each of up to six jobs per reference year. (For 1993, it was collected for up to only three jobs per year.) If there are more than two absences in the year, details are collected on the first and last absence, including:

- # dates and duration;
- # reason for the absence (12 categories);
- # whether or not pay was received during the absence;
- # whether or not the person looked for work, and during which months. (Persons on temporary layoff, i.e. expecting to return, are asked about job search. For other types of absences, one would not expect the person to have undertaken job search.)

1994

The number of absences in a job spell is also recorded.

Users are cautioned that it is difficult to link this information to the data on monthly receipt of employment insurance benefits, workers' compensation and social assistance (Theme 12), as the latter is aggregate information and does not relate to a specific job or absence.

More information on SLID data pertaining to absences, as well as on comparisons between SLID and the Absence from Work Survey, is found in SLID Working Paper No. 96-10.

INCOME AND WEALTH

Theme 11. Income sources

The variables under this theme cover annual income amounts reported for the individual. Family income variables are grouped under the theme of Family and household characteristics, but are described here.

Respondents are given the option of providing access to their tax file records from Revenue Canada instead of reporting the income by interview. Some minor differences exist in the income components as collected by either route. These differences are reconciled during processing.

The approach consists of making the definitions of the income components as consistent as possible, by excluding items that are available in only one of the two sources. Table 9 at the end of this section on the income theme provides more information on the comparability of the data from the two sources.

Family income

The income measures are provided at the economic family as well as the individual level. Family income information in the microdata files is the sum of the individual incomes of people living together as part of the same economic family on December 31 of the reference year.¹³

Main income sources

The following are the income components appearing on the file:

-
13. Exploratory work has been carried out for SLID on the calculation of family income using a prorated approach, which takes into account changes in family composition over the year, and a subannual approach, which extends the prorated approach to obtain monthly income based on the family composition in each month. For more details, see Working Paper No. 94-13, *Calculation of Family Income for SLID*.

1994

Wages and salaries refers to earnings from all paid worker jobs held during the year. Also included are the earnings of owners of incorporated businesses (although some amounts may also be reported as investment income);

Farm self-employment income. Net income received by farm owner-operators (or partners). The amounts may be negative;

Non-farm self-employment income. Net income received by unincorporated owner-operators of businesses. The amounts may be negative;

Total earnings. The sum of wages and salaries, and net self-employment income;

Investment income. Includes interest from bank accounts and other deposits, net dividends and other investment income. Taxable investment income is also provided. Compared to the Revenue Canada data, the only difference with the data collected by interview is that it includes taxable dividends rather than net dividends. Taxable dividends are equal to net dividends x 125%;

Taxable capital gains. Not counted in total money income but included because it enters into the derivation of taxes payable;

Government transfers. The total received from government transfers is provided, along with the following components;

- < Child Tax Benefit,
- < Old Age Security, Guaranteed Income Supplement and Spouse's Allowance,
- < Canada Pension Plan and Quebec Pension Plan benefits,
- < Employment Insurance benefits,
- < Social assistance and Provincial Income Supplements,
- < Workers' Compensation,
- < GST credits,
- < Taxable government transfers,
- < Non-taxable government transfers.

For Employment Insurance, social assistance and Workers' Compensation, the months in which income was received are also collected — see Theme 12.

Pension income. This includes income from employer pensions, RRSP annuities, and RRIF withdrawals.

RRSP Withdrawals.

Alimony and child support. This is mainly amounts received under court orders or written agreements. Alimony and child support paid by an individual is not collected by SLID.

Other taxable income. Income from sources other than those noted above, and taxable (therefore reported on the tax return).

1994

Total income variables

There are 3 total income variables on the file. *Total money income* includes taxable income as well as non-taxable items that appear on the tax return, such as Workers' Compensation and social assistance. *Total income (RCT definition)* corresponds to Line 150 of the T-1 tax return, and is included in case it might be of interest to some users. Finally, *after-tax income* is total money income minus taxes payable. *Total money income* includes all of the components listed above, with the exception of capital gains and RRSP withdrawals. (In the case of investment income, the net value rather than the taxable amount is used.)

There are some differences between the definition of total money income and that used by the Survey of Consumer Finances, because some non-taxable income sources included in the SCF total are not available from tax data. These items are excluded in SLID, to ensure that income data collected by interview and through the tax system are as comparable as possible.

Other variables related to income

Other variables under the Income theme include amount of income tax paid, source of income data (SLID or Revenue Canada), largest income component, and proportion of total family income supplied by the individual.

Low income variables

The total money income of each person's economic family is compared with a low income threshold or cut-off. Statistics Canada's low income cut-offs are in wide use and are the main concept promoted by Statistics Canada for determining low income status of families. The low income cut-offs are based on expenditure patterns, and are periodically rebased to reflect changes in these patterns. In 1992, the low income cut-off was set at 54.7% of average family income. This percentage was obtained by adding 20 percentage points to the Canada average family expenditure on food, shelter and clothing, expressed as a percentage of pre-tax income. In years when family expenditure data are not collected, the cut-offs are updated to reflect changes in the Consumer Price Index. Separate cut-offs are calculated for:

- # different family sizes (from 1 to 7 persons)
- # different size of area of residence groups (5 categories in all)
- # before-tax and after-tax income.

There are therefore 70 cut-offs in all for each reference year, which are given in Table 8. Each person is assigned two low-income values, one for use with before-tax income, the other for use with after-tax income. These cut-offs, which reflect the person's family size and size of area of residence, are suppressed on the external file to protect confidentiality, but several variables based on the cut-off appear on the file, including:

1994

whether or not the person's family income is below the low income cut-off

the ratio (group) of the person's family income to the relevant low income cut-off

These variables are calculated both before tax and after tax.

SLID Working Paper No. 97-09 contains further information on the concept of size of area of residence and its use in deriving the low income cut-offs. It also provides an overview of the use of geography in SLID.

An alternative measurement of low income, called the LIM (low income measure) was introduced by Statistics Canada in the 1990 edition of **Income Distributions by Size in Canada** (Catalogue 13-207). The LIM is based on one-half median adjusted family income (where "adjusted" reflects accounting for assumed differences in needs for families of varying size).

Table 8 contains the LIMs, both before tax and after tax. To derive "adjusted" family income, divide the economic family income by the family equivalence scale. (Two alternate family equivalence scales are provided on the file. See discussion in section on "Family and household characteristics".) If the "adjusted" family income is less than the LIM, the family is considered to be "low income" by this definition.

TABLE 8a. Low income cut-offs for 1993 (1992 base), and low income measures, before tax and after tax

Size of family unit	Low income cut-offs				Rural areas	Low income measure
	Size of area of residence					
	500,000 and over	100,000 to 499,999	30,000 to 99,999	Less than 30,000		
Before tax						
1 person	16,482	14,137	14,039	13,063	11,390	12011
2 persons	20,603	17,671	17,549	16,329	14,238

4 persons	26,209	22,077	21,736	19,862	17,184	
5 persons	29,294	24,675	24,293	22,199	19,206	
6 persons	32,378	27,273	26,851	24,537	21,229	
7 or more persons	35,462	29,871	29,408	26,874	23,252	

Similarity of income components to those of the Survey of Consumer Finances

SLID uses the same income questionnaire as the Survey of Consumer Finances (SCF). However, after reconciling data accessed from Revenue Canada and those collected by interview, some differences exist in SLID income components compared to SCF. For more information, refer to SLID Working Paper No. 96-07, *Comparison of Income Estimates from the Survey of Consumer Finances and the Survey of Labour and Income Dynamics*.

TABLE 9. Definitions used to merge SLID income data from survey and tax sources

Variable	Survey source	Tax source	Comments on comparability
1. Employment income			
Wages and salaries	Wages and salaries Q1	Employment (wage and salary) income L101	Fringe benefits: In 1993, not reported in survey data (at least in principle), but they are in tax data. From 1994 onward, fringe benefits included with wages and salaries in both sources.
Farmself-employment net income	Farm self-employment net income Q2	Farming income L141	Checked for consistency with class of worker and industry as reported in labour interview. Persons reporting income here should have an unincorporated farm.
Non-farm self-employment net income	Non-farm self-employment net income Q3	Business, professional, commission, fishing income L135, L137, L139, L143	Consistency check with class of worker and industry.

1994

TABLE 9. Definitions used to merge SLID income data from survey and tax sources- Continued

2. Investment income			
Investment income (incl. net dividends)	Interest Q4 + net dividends Q5 + other investment income Q7	Dividends L120 (x.8) + Interest & other investment income L121 + Net partnership income L122 + Net rental income L126	<ul style="list-style-type: none"> - Only broad category of investment income is available) many differences between the two sources <i>within</i> investment category. - Interest from loans and mortgages and regular income from a trust fund or estate included with other investment income in the survey. No direct reference to these items on tax form.
Taxable investment income (incl. taxable dividends)	Interest Q4 + taxable dividends Q5 (x 125%) + other investment income Q7	Dividends L120 + Interest & other investment income L121 + Net partnership income L122 + Net rental income L126	<ul style="list-style-type: none"> - Survey collected net dividends. Taxable dividends obtained by multiplying net (i.e., real) dividends by 125%. From 1994 onwards, survey asks for taxable dividends. - Only difference between the 2 investment variables is treatment of dividends. Investment income used for total money income. Taxable investment income used for calculating taxes payable.
3. Government transfers			
Child tax benefits	Child tax benefit Q8	Not on T1 but available	For survey route, amount calculated based on number of children and net family income.
Old Age Security, Guaranteed Income Supp, Spouse's Allowance	OAS/GIS/SPA Q9	OAS L113 + Federal supplement L146	OAS and GIS/SPA available as separate variables, because OAS is taxable and GIS/SPA is not. On survey side, amount in Q9 can be split because OAS is generally a standard amount.
Canada or Quebec Pension Plan benefits	CPP/QPP Q10	CPP/QPP L114	
Employment Insurance benefits	EI benefits Q11	EI benefits L119	
Social assistance	SA and PIS Q12	Social assistance L145	
Workers' Comp. benefits	WC Q13	WC L144	
Goods and Services Tax Credit	GST credit Q14) imputed if eligible and GST not reported	Not on T1. Imputed based on family income	Note that GST credits also imputed to eligible survey respondents.

TABLE 9. Definitions used to merge SLID income data from survey and tax sources- Concluded

3. Government transfers			
Taxable government transfers			Roll-up of OAS, CPP/QPP and EI. Excludes taxable income from government sources other than those listed above, which is counted in other taxable income.
Non-taxable government transfers			Roll-up of CTB, GIS/SPA, GST credits and Worker's Compensation.
4. Pension income			
Employer pension, RRSP withdrawals and RRIF annuities	Employer pensions Q18 + RRSP annuities & RRIF withdrawals Q19	Other pensions or superannuation L115 + RRSP income (annuity or withdrawal) if age 65+ L129	In tax data, cannot distinguish between RRSP annuities and withdrawals from unmatured RRSPs (which we are not counting as money income). Assumption is made that, for persons 65+, amount in L129 is an annuity; for persons under that age it is a withdrawal.
5. Other taxable income			
Alimony & child support	Alimony, separation allowance, child support Q21	Alimony or maintenance income (taxable) L128	On tax side, generally refers to amounts paid under agreement or court order. Survey refers to same thing and references L128.
Other taxable money income	Other taxable money income) taxable subset of Q17, Q23, Q24 & Q25	Other income L130 + L104	Ex: severance pay, income maintenance, employer or union supplementary Employment Insurance benefits, Children's Aid payments, scholarships, death benefits. Also other taxable government income from sources not explicitly identified above.
6. Items not included in money income but needed to determine taxable income			
RRSP withdrawals	RRSP withdrawals Q20	RRSP income (annuity or withdrawal) if <age 65 L129	Withdrawals from unmatured RRSPs not counted in total income, but included in taxable income. See note under pension income.
Taxable capital gains	Capital gains Q6	Taxable capital gains L127	Taxable is 75% of net. Taxable capital gains included in total taxable income but excluded from total money income.
7. Other excluded items			
Provincial tax credits	Provincial tax credits Q15	Prov tax credits L479	Excluded because data on tax side not available for some provinces. Also, on survey side, appeared to be substantially under-reported.
Veterans' pensions	Veteran's Pensions Q16		Collected in survey but not included in merged dataset (or any income totals) because not reported in tax data.

1994

**Theme 12.
Monthly
receipt of
employment
insurance
benefits,
workers'
compensation
and social
assistance**

For these three types of government transfers, SLID asks when (in which months) the income was received. Amounts received over the year as a whole are also collected. These amounts are grouped with the other income variables under the Income theme. The information on months in which these three income sources were received can be used to study receipt patterns in relation to job absence and unemployment spells, for example. Users are cautioned, however, that this type of analysis can be difficult in cases where the respondent had two or more jobs in the same month.

Until the recent reforms to the Employment Insurance (EI) system, eligibility for benefits was based on the number of weeks of work in the previous year, as well as the unemployment rate in the claimant's region. For users wishing to relate SLID data to this information, Table 10 contains the eligibility guidelines, while Table 11 provides the unemployment rates for the relevant reference years.

Note on boundaries of Employment Insurance Regions

The employment insurance region (EIR) codes on the SLID data files represent the regions that came into effect along with the EI reforms in July of 1996. Table 11b, which shows the 1994

unemployment rates by region, also uses this new geography. However, the 1993 rates given in Table 11a reflect the prior set of boundaries. There is no simple relationship between the two geographies; thus, users are cautioned against comparing the two sets of figures, or trying to link SLID data to the figures in Table 11a. However, following is a brief summary of how the geography of the EIRs changed:

The EIRs corresponding to census metropolitan areas (CMAs) did not change, other than 1991-1996 changes to the CMAs themselves (see *1996 Census Dictionary*, Statistics Canada Catalogue 92-351-XPE), with the following exceptions: i) Fredericton, Saint John, and Moncton now form a single EIR; ii) The EIR of St. John's excludes some of the fringe municipalities of the CMA, due to their economic dissimilarity from the rest of the CMA. Note also that the CMA of Ottawa-Hull is, as before, divided into 2 EIRs by the Ontario-Quebec border.

Outside of CMAs, the new EIRs were re-delineated based on census divisions (counties) of similar economic characteristics.

1994***Under the family and household characteristics theme***

Patterns of income receipt from these three sources are also available for economic families: variables show whether anyone in the person's family received these sources of compensation, and in which months.

EDUCATION***Theme 13.
Educational
activity***

Educational activity tracks enrolment in formal education programs year by year during the life of the panel, as follows:

- # Student status, full-time or not, and months attended during reference year.
- # Type of school attended (elementary or high school; university; and several categories of non-university postsecondary institution, namely, community college, business school, trade school and CEGEP).
- # Whether graduated from high school, received a university certificate or a non-university postsecondary certificate during the year.

In addition to being important on their own, educational activity variables are used to update educational attainment (below). A few family variables are also based on educational activity.

Theme 14. Educational attainment

Attainment

Detailed educational attainment, or level of schooling, is established during the first interview with each respondent. Any changes in attainment are derived from educational activity reported each year. For children under 16 years of age, the school grade is recorded. Attainment information includes:

- # Province or territory where the person received most of his/her elementary and secondary education. This provides an indicator of long-term mobility;
- # Years of schooling, in total and at each type of institution: elementary and high school; university; non-university postsecondary;
- # Graduation from high school (yes/no);
- # Whether or not the person was ever enrolled in a university or any other type of postsecondary institution;
- # Degrees, diplomas or certificates received and the age/year when the highest or most recent was received. See note on coverage of postsecondary certificates, below;

The general level of educational attainment of the person's mother and father is also available under the Ethnocultural theme.

1994

Coverage of postsecondary certificates.

Information on degrees, diplomas or certificates apply to all those held by the person, unless the person holds more than one university degree or more than one non-university diploma at the time of the preliminary interview. In such cases, the preliminary interview covers the *highest* university degree (or other certificate) and the *most recent* non-university postsecondary diploma (or other certificate), as these are considered to have the greatest relevance. This information is updated each year to incorporate any degrees, diplomas and certificates received during the year.

Program length in full-time equivalents (years).

Several of the education variables use this concept, for example, *years of school attendance* and *time taken to complete a program*. In all cases, part-time school attendance is valued at .5 of full-time school attendance and years with a mixture of full-time and part-time are valued at .75 of full-time.

Postsecondary certificates

See also Attainment, above. The following detailed information is collected on certificates:

type of certificate (postsecondary non-university certificate; university certificate below Bachelor's level; Bachelor's degree; University degree above Bachelor's level; Master's degree; Degree in medicine, dentistry, veterinary medicine or optometry; Doctorate or PhD);

the type of postsecondary institution (several categories in addition to university);

age/year received;

the field of study (several groupings);

the time taken to complete the program, in full-time equivalents.

For more information on education variables, see SLID No. 95-02, *SLID Coding Structure: Major Field of Study for Postsecondary Graduates* and No. 95-09, *SLID Derived Variables: Educational*

11**GUIDELINES FOR
ANALYSIS AND PRESENTATION**

***Applying
weights***

The microdata on the public use file are unweighted. It is the responsibility of data users to apply the appropriate weights in any results they wish to produce. If proper weights are not used, the estimates derived from the microdata cannot be considered to be representative of the survey population, and will not correspond to those that would be produced by Statistics Canada. The weights are provided as variables under “Sample control” (See the beginning of Chapter 10).

However, either weighted or unweighted data may be used to check that tabulations have been carried out correctly, before analysis and publication. The electronic user’s guide includes weighted and unweighted counts for each categorical variable on the file. They appear next to the categories for each variable. For numerical variables, certain means and ranges are provided.

For information on selecting weights in the Survey of Labour and Income Dynamics, see Chapter 5, “Weights”.

Rounding guidelines

Once it has been determined whether the results obtained are reliable, the level of rounding indicates the level of *precision* that the data can actually support. The following guidelines for rounding should be used:

Estimates of population sub-groups should be rounded to the nearest hundred units.

Rates and percentages should be rounded to one decimal point.

Note that all calculations are to be derived from their unrounded components, and then rounded using the normal rounding technique.

In normal rounding, if the first or only digit to be dropped is 0 to 4, the last digit to be retained is not changed. If the first or only digit to be dropped is 5 to 9, the last digit to be retained is raised by one. For example, in normal rounding to the nearest 100, the estimate 49,448 would be rounded down to 49,400 and an estimate of 49,252 would be rounded up to 49,300. The figure 1.78% would be rounded to 1.8%.

Missing values and reserved codes

There are a few types of missing values on the public use file. First, when a variable has been suppressed for confidentiality, there are no data values at all for that variable. The data dictionary indicates which variables are suppressed, and in most cases there is a replacement variable with less detailed categories.

1994

If the coverage of a variable does not extend to a certain population sub-group, then there are no valid values for that sub-group and the values that do appear are in the form of 9, 99, 9.9 and so on, which indicates that the variable is not applicable. The coverage of each variable on the file is referred to in the data dictionary as the “population”.

For certain records, no valid value is available, although the variable is applicable. Possibly the respondent did not provide the information or it failed an edit in processing, and the value was not imputed. Such missing values appear with a code such as 7, 97, 9.7, and so on depending on the format. For certain variables, the number of missing values has been reduced through imputation. Missing values for the income variables have been entirely imputed, but most other variables may have missing values. See “Imputation” in Chapter 7, “Data Edits and Treatment of Non-Response”.

The approach for dealing with missing values of this last kind depends on the type of analysis being carried out and the extent of missing data.

Although the end solution may be to exclude the records with missing values from the analysis, a review should first be carried out to assess the impact of missing values on the overall representativeness of the data. Is it possible that a bias results from the missing data — for example, are the (other) characteristics of the people with missing values different from those of the observed part of the sample? It may be necessary to take

into account the possible impact in some way. In all cases, analysts should note exclusions of records with missing values in their published results.

For respondents who are out of scope in a given year, the data appear with a code such as 6, 96, 9.6 and so on.

Finally, a few values may have been coded as 8, 98, 9.8, etc. These represent refusals to particular items in the interview.

12**GUIDELINES FOR RELEASE
(DATA QUALITY)**

Microdata users should apply the rules for assessing data quality, below, to all estimates they produce, and retain only those that satisfy the release criteria. Estimates that do not satisfy the release criteria are not reliable.

Introduction

The guidelines for release and publication make use of the concept of *sampling variability* to determine whether estimates obtained from the microdata are reliable. Sampling variability is the error in the estimates caused by the fact that we survey a sample rather than the entire population. The concept of *standard error* and the related concept of *coefficient of variation* and *confidence interval* provide an indication of the magnitude of the sampling variability.

The standard error and coefficient of variation do not measure any systematic biases in the survey data which might affect the estimate. Rather, they are based on the assumption that the sampling errors follow a normal probability distribution.

Subject to this assumption, it is possible to estimate the extent to which different samples that have the same design and the same number of observations would give different results. This indicates the margin of error that is likely to be included in the estimates derived from our single sample.

For a detailed description of the measures of sampling variability, see A. Satin and W. Shastry, *Survey Sampling: A Non-Mathematical Guide*, Statistics Canada, Catalogue 12-602E.

Minimum sizes of estimates for release

In general, the smaller the sample, the greater the sampling variability. Likewise, estimates of small population subgroups are less reliable than estimates of large population subgroups. The minimum allowable sizes of estimates, also called the release cut-offs, are a quick rule for determining whether an estimate can be released, before applying the more rigorous test that uses the coefficient of variation. The release cut-offs are calculated specifically for the Survey of Labour and Income Dynamics, based on the sample size and the sample design.

Both the cut-offs for the unweighted count and the weighted count must be satisfied:

Unweighted count. The number of observations must be at least 25. If the unweighted count is less than 25, then the weighted estimate should not be released regardless of the value of its coefficient of variation.

Weighted count. The table below shows the minimum levels for weighted counts by geographical area. For estimates which do not satisfy the cut-off for the weighted count, but which do satisfy the cut-off for the unweighted

1994

count, microdata users should follow the guidelines which use the coefficient of variation (following section).

For an estimate obtained from a numeric variable, such as an average, the same cut-off is compared with the estimate of the population to which the value applies (for example, the total number of hours worked by paid workers applies to the population of paid workers).

TABLE 12. Release cut-offs based on the weighted estimate

CANADA	22,500
Newfoundland	4,000
Prince Edward Island	2,000
Nova Scotia	8,500
New Brunswick	4,000
Quebec	27,000
Ontario	28,500
Manitoba	10,000
Saskatchewan	4,000
Alberta	11,500
British Columbia	21,500

Using the coefficient of variation (CV)

The standard error of an estimate is frequently expressed as a percentage of the estimate itself, in which case it is called the coefficient of variation. Whereas the standard error is measured in the same

units as the estimate, the coefficient of variation is simply a ratio. This makes it easier to use as a criterion for the reliability of any estimate.

In the “Data Quality Report” contained in this Guide, a set of Approximate Sampling Variability Tables has been provided to give microdata users some approximate coefficients of variation (CVs) for groups of estimates at a time, such as all estimates pertaining to a particular province. In most cases, these will be adequate to determine whether an estimate can be released. The Data Quality Report explains how to obtain the approximate CV from the tables, depending on whether the estimate is a simple population count or a percentage, difference or ratio of population sub-groups. In the case of numeric totals or means, the CV is generally larger than the CV of the population count on which it is based (e.g. total hours worked by paid workers, as compared to the number of paid workers).

1994

TABLE 13. Acceptable levels of the coefficient of variation

Approximate coefficient of variation (%)	Restriction on use
0.0 - 16.5	Estimates can be considered for general unrestricted release.
16.6 - 25.0	Estimates can be considered for general unrestricted release but should be accompanied by a warning cautioning subsequent users of the high sampling variability associated with the estimates.
25.1 - 33.3	Estimates can be considered for general unrestricted release only when exact coefficients of variation have been calculated and are found to be acceptable. Otherwise, such estimates should not be used or released.
33.4 or greater	Estimates should not be used or released under any circumstances.

To show that an estimate has been suppressed from a cell in a table of estimates, it is usual to replace the estimate with the notation "--".

Exact coefficients of variation for specific estimates may be obtained from the Survey of Labour and Income Dynamics on a cost-recovery basis. The exact coefficients of variation are calculated using a technique called "jackknifing". This technique involves dividing the records on the microdata files

into subgroups (replicates) and determining the variation in the estimates obtained from the different subgroups. For more information, see C.E. Särndal, B. Swensson and J. Wretman, *Model Assisted Survey Sampling* (New York: Springer Verlag) or K.M. Wolter (1985), *Introduction to Variance Estimation* (New York: Springer Verlag).

Hypothesis tests provided by statistical software packages

Microdata users should be aware that the results of hypothesis tests (such as the p values accompanying t statistics or Pearson statistics) that are provided automatically by standard statistical software packages are incorrect for data provided by surveys with a complex survey design, such as SLID's. Such packages calculate these test results under the assumption of simple random sampling. That is, they do not take into account the special sample design features of SLID such as stratification, clustering, and unequal selection probabilities. While many of the standard packages can account for the unequal selection probabilities in the production of estimates by allowing the use of weights, these packages do not properly take the sample design into account when producing variance estimates that form part of most test statistics.

Some suggestions for carrying out hypothesis testing for SLID data are described below. It must be noted that these methods provide only rough approximations.

1994

The section entitled *Data Quality Report* at the end of this document provides information on how to use the coefficient of variation tables to derive approximate variance estimates for estimated counts and proportions and for simple functions of these quantities such as differences and ratios. These variance estimates can then be used to form test statistics. The *Data Quality Report* also contains a table of approximate design effects; the appropriate design effect from this table can be multiplied by the variance estimate calculated by a standard statistical package to obtain an alternative approximate variance estimate. Although a bit more difficult, the former method has been found to provide better approximations, particularly for functions of counts and proportions.

In situations where you want to perform hypothesis tests on more sophisticated characteristics, such as on the coefficients of a linear regression model, a two-step method can be employed with the standard statistical software to form the test statistics. First, estimate the characteristics of interest using the weights provided on the microdata file. Second, obtain approximate variance estimates of these characteristics by rerunning the same software procedure as that used for producing the characteristic estimates but using a scaled weight that consists of the original weight divided by the average of the original weights of all the observations being used in your computations. The quantities calculated in the two steps can then be combined to form test statistics.

It should be noted that better design-based variance estimates cannot be obtained through the use of statistical software specifically designed for survey data. This is because the design information required by these software packages is not currently available on the SLID data file due to confidentiality considerations. However, better variance estimates can be produced by Statistics Canada on a cost recovery basis.

Non-sampling errors

Non-sampling errors are any errors that can arise from reasons not related to the fact that the survey is conducted on a sample rather than a census of the population. They may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered on the computer and errors may be introduced in processing.

Over a large number of observations, randomly occurring errors will have little effect on estimates derived from the survey. However, errors occurring systematically will contribute to biases in the survey estimates. Considerable time and effort was made to reduce non-sampling errors in the survey. Quality assurance measures were implemented at each step of the data collection and processing cycle to monitor the quality of the data. These measures included the use of highly skilled interviewers, extensive training of interviewers with respect to the survey procedures and computerized

1994

questionnaires, observation of interviewers to detect problems of questionnaire design or misunderstanding of instructions, and coding and edit quality checks to verify the processing logic.

With the use of computer-assisted interviewing, the sources of non-sampling errors have changed somewhat compared to paper-and-pencil interviewing. The possibility of data entry errors has been greatly reduced. (Some loss of data has occurred in transmission between interviewers and Statistics Canada offices, but these errors should disappear as the experience with computer-assisted interviewing grows.)

Computer-assisted interviewing has made it possible to use dependent interviewing where appropriate. Dependent interviewing is a key technique for improving the quality of reported information in a panel survey. It is described in Chapter 6, "Collection methods". See also SLID No. 95-06, *Dependent Interviewing: Impact on Recall and Labour Market Transactions*.

Although computer-assisted interviewing has made it possible to reduce respondent recall problems, they are still a concern in SLID, and must be recognized as a possible source of non-sampling error. Some SLID Working Papers which deal with the topic are No. 92-04, *The Measurement of Job Search and Unemployment in a Retrospective Setting* and No. 92-05, *Dealing with the Seam Problem for the Survey of Labour and Income Dynamics*.

Like many other household surveys conducted by Statistics Canada, SLID accepts proxy reporting, provided the person interviewed is knowledgeable about other household members. This introduces some differences in reported information compared with what would be obtained solely through self-reporting, but it also raises the level of overall response and reduces collection costs. SLID

Working Paper No. 92-08, *Self/Proxy Respondent Rules and Data Quality* contains a review of studies on the impact of proxy response based on other surveys with similar subject matter to SLID.

Introduction

The Data Quality Report includes the Approximate Sampling Variability Tables for the Survey of Labour and Income Dynamics. More details on how to obtain the approximate coefficient of variation for a statistic are provided below, under “Obtaining approximate CVs from the tables”.

The coefficient of variation of a statistic is largely a product of the total survey sample size and the importance of the sub-population in the total Canadian population. Finally, it depends on the level of non-response and the particular sample design. For general purposes, this report includes a table on the population sizes and sample sizes per province (Table 14) and a table of response rates by province (Table 15).

The coefficients of variation in the tables were derived using the variance formula for a simple random sample adjusted by a factor called the “design effect”. The design effect takes into account the multi-stage, clustered sample design that was used for the Survey of Labour and Income Dynamics. A table of design effects is also included as an alternative to using the approximate coefficients of variation (Table 16). The design

effects provided in the table were derived by computing an exact design effect for each of several variables, then choosing the 75th percentile from these exact values. In general, the result is that design effects in the table will be greater than the exact design effect for 75% of the variables, leading to an overestimation of the CV for most variables. This conservative approach is judged to be preferable for hypothesis testing.

Exact coefficients of variation can be derived as required for a specific estimate using a technique known as the jackknife. This involves dividing the records on the microdata files into subgroups (or replicates) and determining the variation in the estimates obtained from each replicate for the same characteristic. Users wishing exact coefficients of variation may contact Statistics Canada.

Sample size

Table 14 shows the total survey sample and the distribution by province as follows. The weighted sums, which have been calculated to arrive at actual known population counts, are also shown.

1994

TABLE 14. Number of persons aged 16 and over on December 31st of reference year

Province	Sample Size		Population	
	1993	1994	1993	1994
Canada, excluding Territories	29,650	29,632	22,188,457	22,502,684
Newfoundland	1,755	1,776	446,790	446,260
Prince Edward Island	703	669	100,491	102,326
Nova Scotia	2,047	2,013	710,150	715,936
New Brunswick	1,901	1,905	580,822	585,912
Quebec	5,756	5,584	5,632,826	5,680,168
Ontario	8,002	8,075	8,389,787	8,519,994
Manitoba	1,983	1,985	828,126	832,505
Saskatchewan	2,186	2,140	728,218	732,572
Alberta	2,696	2,825	1,988,199	2,015,939
British Columbia	2,621	2,660	2,783,048	2,871,072

Response rates

A full description of response rates as defined in SLID is provided in Chapter 7, “Data edits and treatment of non-response”. Briefly, the cross-sectional response rate is defined at the level of households and the longitudinal response rate is defined at the level of individuals.

For the purposes of the cross-sectional rate, a household is considered respondent for the year or wave if at least one individual in the household is respondent to the wave, and an individual is defined as respondent to the wave if he or she responded to at least one interview in the wave.

For the purposes of the longitudinal response rate, an individual is considered respondent if he/she answers either the January or the May interview in all years of the survey up to and including that wave.

TABLE 15. Response rates, by province (after imputation)

Province	Collection				
	1993	1994		1995	
	Longi- tudinal	Cross- sectional	Longi- tudinal	Cross- sectional	Longi- tudinal
	%				
Newfoundland	90.9	94.5	85.6	To be determined	
Prince Edward Island	90.7	96.2	87.6		
Nova Scotia	85.2	92.1	77.6		
New Brunswick	86.9	91.3	79.1		
Quebec	87.8	93.9	82.3		
Ontario	87.7	91.2	79.1		
Manitoba	88.0	92.5	80.8		
Saskatchewan	89.1	94.6	83.7		
Alberta	88.7	92.0	81.2		
British Columbia	85.2	91.4	77.3		

Obtaining approximate CVs from the tables

Approximate coefficients of variation (CVs) are shown in the Approximate Sampling Variability Tables at the end of this chapter. Before applying the criterion of the coefficient of variation, first follow the guidelines based on sample sizes and population sizes described in Chapter 12, “Guidelines for release (Data quality)”.

1994

It is important to assess the reliability not only of simple estimates but also of percentages, differences between estimates, and ratios. The same tables can be used, as described below. For estimates based on numeric variables, refer to *Case 6* below.

Each CV table is valid for a different level of geography and a different set of variables. For example, there are different CV tables for statistics at the Canada level and for each province. Within a province, there are three tables defined for a specific group of variables, depending on the degree to which the survey sample “design effects” differ. The three tables for each province are defined according to the themes outlined in Chapter 10, “Thematic Description of Content”:

- < Theme 2, Ethnocultural characteristics
- < Theme 7, Labour market activity patterns
- < All remaining themes

The analyst should first determine the appropriate table for the estimate and then follow the procedures below to find the approximate coefficient of variation. Then, to know whether the estimate is sufficiently reliable, compare the approximate coefficient of variation with the ranges shown in Table 13, “Acceptable levels of the coefficient of variation”, in Chapter 12, “Guidelines for Release (Data Quality)”.

The following guidelines should be used to decide which table is the most appropriate:

- < determine level of geography: If the estimate relates to the national level or to a particular province or sub-provincial region, this decision is straight-forward. For groups of provinces, it will be necessary to use the tables for all provinces involved;
- < determine the appropriate theme: Use the record layout to identify the theme in which the variable(s) of interest fall(s). If the estimate is the result of a cross-tabulation of variables which fall under different themes, then the user should use tables for all themes involved or choose the theme relating to the variable of greatest interest;
- < if one chooses more than one CV table due to grouping of provinces, use the instructions below to calculate the CV for each of the provinces involved. Then use the *minimum* of all these calculated CVs;
- < if one chooses more than one CV table due to the use of multiple variables, use the instructions below to calculate the CV for each of the themes involved. Then use the *maximum* of the all these calculated CVs.

For certain applications, such as hypothesis testing of parameters in a regression model, it is necessary to use the table of design effects (Table 16), which is also defined by geography and variable group.

1994

Another possibility for accounting for the complex sample design is to rescale the weights so that the average non-zero weight is one (by dividing each weight by the overall average weight). This cannot be done when estimating totals, but will allow the user to perform approximately correct hypothesis tests of means, proportions and regression coefficients without using the CV tables or the design effect table.

CASE 1. Simple estimates of population counts

In this simplest case, only the size of the estimate is required. On the lefthand side of the appropriate table, locate the number that is equal or closest to your estimate. Follow this line across to the first figure encountered. This is the approximate coefficient of variation.

Example 1. Several examples are provided here as they will also be used in subsequent examples. Using the cross-sectional labour weight for reference year 1993 data, one estimates:

NUMBER OF SELF-EMPLOYED 16 to 69 Years of Age		
Province	Sex	
	Male	Female
Newfoundland	19,798	10,721
British Columbia	257,298	159,995

To determine the approximate CV for the first estimate:

- < determine the level of geography:
Newfoundland;
- < determine the content theme: Self-employed is in Theme 7;
- < look down the rows to the one corresponding to the estimate: 20,000 is the closest value to 19,798;
- < select the first number in the row: 12.4. This is the approximate CV for this estimate.

In a similar fashion, one can determine that the approximate CV for the remaining three estimates are 17.0, 8.1, and 10.7, respectively.

CASE 2. Proportions or Percentages

The coefficient of variation of an estimated proportion or percentage depends on both the size of the proportion or percentage and the size of the total upon which the proportion or percentage is based. (i.e., the numerator of the proportion or percentage). Percentages are relatively more reliable than the corresponding sub-population (numerator). This can be seen by the decreasing values of the CVs across each line of a table: as the percentage across the top of the table increases, the CV decreases.

1994

Using the numerator, follow the steps described above for obtaining a CV for that estimate. However, rather than take the first figure on the appropriate row, read across the top line to find the percentage that is closest in value to your percentage. Follow this column down to the intersection with the row you already identified. The figure at the intersection of the row and the column is the CV for the percentage.

Example 2.

One can determine the following totals for the purpose of deriving percentages:

NUMBER OF PERSONS 16 to 69 Years of Age		
Province	Sex	
	Male	Female
Newfoundland	223,665	223,135
British Columbia	1,371,152	1411896

Using these estimates along with the estimates from *Example 1*, one can derive:

PERCENT OF SELF-EMPLOYED 16 to 69 Years of Age		
Province	Sex	
	Male	Female
Newfoundland	<u>19,798</u>	<u>10,721</u>
	223,665	223,135
	8.9%	4.8%
British Columbia	<u>257,298</u>	<u>159,995</u>
	1,371,152	1,411,896
	18.8%	0.113

To derive the approximate CV for these four estimates, use the same CV tables as for *Example 1*. However, instead of using the first number in the appropriate row, use the number in the column corresponding to the estimated percentage. In this way, the approximate CVs of these four estimates are 12.1, 16.7, 7.6, and 10.4, respectively.

CASE 3. Differences between population counts or percentages

The standard error of a difference between two estimates is approximately equal to the square root of the sum of squares of each standard error considered separately. That is, the standard error of a difference ($\hat{d} = \hat{X}_1 - \hat{X}_2$) is:

$$F_{\hat{d}} = \sqrt{(\hat{X}_1 \cdot c_1)^2 + (\hat{X}_2 \cdot c_2)^2}$$

where \hat{X}_1 is estimate 1, \hat{X}_2 is estimate 2, and c_1 and c_2 are the coefficients of variation of \hat{X}_1 and \hat{X}_2 respectively. The coefficient of variation of \hat{d} is given by $F_{\hat{d}}/\hat{d}$. This formula is accurate for the difference between separate and uncorrelated characteristics, but is biased otherwise.

Example 3. Using estimates and their approximate CVs from *Example 2* above, one can derive the difference between the percentage of self-employed males and self-employed females:

1994

Newfoundland 8.9% - 4.8% = 4.1%
 British Columbia 18.8% - 11.3% = 7.5%

First obtain the standard error of the difference for Newfoundland $\bar{d} = (.089 - .048) = .041$ is:

$$F_{\bar{d}} = \sqrt{[(.089)(.121)]^2 + [(.048)(.167)]^2}$$

$$= \sqrt{(.000116) + (.000064)}$$

$$= .013$$

The coefficient of variation of \bar{d} is given by $F_{\bar{d}}/\bar{d} = .013/.041 = 0.32$. So the approximate coefficient of variation of the difference between the estimates for Newfoundland is 32%. In a similar fashion, one can estimate the CV of the difference for British Columbia as 25%.

CASE 4. Estimates of Ratios

In the case where the numerator is a subset of the denominator, the ratio should be treated as a percentage (as in *Case 2*).

In the case where the numerator is not a subset of the denominator (e.g., the ratio of the number of full-time paid workers who had at least one absence from work in the reference period as compared to the number of part-time paid workers who had at least one absence from work in the reference period), the standard deviation of the ratio of the estimates is approximately equal to the square root

of the sum of squares of each coefficient of variation considered separately multiplied by \hat{R} . That is, the standard error of a ratio ($\hat{R} = \hat{X}_1 / \hat{X}_2$) is:

$$F_{\hat{R}} = \hat{R} \sqrt{v_1^2 + v_2^2}$$

where v_1 and v_2 are the coefficients of variation of \hat{X}_1 and \hat{X}_2 respectively.

The coefficient of variation of \hat{R} is given by $F_{\hat{R}}/\hat{R}$. The formula will tend to overstate the error if \hat{X}_1 and \hat{X}_2 are positively correlated, and understate the error if \hat{X}_1 and \hat{X}_2 are negatively correlated.

Example 4. Using estimates from *Example 1*, one can compare the number of self-employed males and self-employed females in the form of a ratio:

Newfoundland 19,798 ÷ 10,721 = 1.85
British Columbia 257,298 ÷ 159,995 = 1.61

First of all, this estimate is a ratio estimate, where the numerator of the estimate ($= \hat{X}_1$) is the number of male self-employed workers. The denominator of the estimate ($= \hat{X}_2$) is the number of female self-employed workers.

For Newfoundland, the numerator of this ratio estimate is 19,798, with a coefficient of variation of 12.4%. The denominator of this ratio estimate is 10,721, with a coefficient of variation of 17.0%.

1994

So the approximate coefficient of variation of the ratio estimate is,

$$\sigma_{\hat{R}} = \sqrt{\sigma_1^2 + \sigma_2^2}$$

where σ_1 and σ_2 are the coefficients of variation of X_1 and X_2 respectively.

That is,

$$\sigma_{\hat{R}} = \sqrt{(.124)^2 + (.170)^2}$$

$$= 0.210 \quad (21.0\%)$$

For British Columbia, the approximate CV is calculated as 0.134 or 13.4%.

CASE 5. Estimates of Differences of Ratios

In this case, it is necessary to combine two of the calculations described above. The CVs for each of the two ratios are first determined using the method for *Case 4*. Then the CV of their difference is found using the method described under *Case 3*.

Example 5. Comparing the ratio of male to female self-employed workers in Newfoundland and British Columbia, one estimates the difference as $1.85 - 1.61 = 0.24$.

The CVs for each of these ratios were calculated in *Example 4*. Using the formula presented in *Case 3*, the standard error of this difference is 0.444. This leads to an estimated CV of the difference between these ratios as 1.85, or 185%.

CASE 6. Estimates based on numeric variables

The CV of a numeric value (such as hours worked by paid workers) is generally larger than the CV of the population count on which it is based (in this example, the number of paid workers). Thus, if the weighted estimate of the population to whom the quantitative statistic applies is not publishable, then the quantitative estimate will not be publishable either. Approximate CV tables for these estimates are available upon request from Statistics Canada.

CASE 7. How to use the Approximate Sampling Variability Tables to do a t-test

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The sample estimates can be numbers, averages, percentages, ratios, etc. Tests may be performed at various levels of significance, where a

level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

Let X_1 and X_2 be sample estimates for two characteristics of interest. Let the standard error on the difference $X_1 - X_2$ be F_d (as defined above in *Case 3*).

1994

If $t = \frac{\hat{X}_1 - \hat{X}_2}{F_d}$ is between -2 and 2,

then the difference between the characteristics is not significant at the 5% level. If however, this ratio is smaller than -2 or larger than +2, the observed difference is significant at the 0.05 level. That is to say that the characteristics are significantly different.

Example 6. Let us suppose we wish to test, at 5% level of significance, the hypothesis that there is no difference between the proportion of male self-employed workers in Newfoundland and the proportion of female self-employed workers in Newfoundland. From *Example 3*, the standard error of the difference between these two estimates was found to be = .013. Hence ,

$$t = \frac{\hat{X}_1 - \hat{X}_2}{F_d} = \frac{.089 - .048}{.013} = \frac{.041}{.013} = 3.15.$$

Since $t = 3.15$ is greater than 2, it must be concluded that there is a significant difference between the two estimates at the 0.05 level of significance.

CASE 8. Confidence intervals

Estimates are often presented in terms of what is called a confidence interval, to express precision in a meaningful way. Confidence intervals of 90%,

95% or 99% are the most commonly used. They can be calculated using the coefficient of variation.

$$CI_x = [\bar{X} - tX''_x, \bar{X} + tX''_x]$$

where ... X''_x is the coefficient of variation obtained for \bar{X}

- t = 1 if a 68% confidence interval is desired
- t = 1.6 if a 90% confidence interval is desired
- t = 2 if a 95% confidence interval is desired
- t = 3 if a 99% confidence interval is desired.

Example 7. From *Example 1*, the estimated number of self-employed males in Newfoundland is 19,798, with a CV of 12.4%. A 95% confidence interval for this estimate is (14,888, 24,708).

$$\begin{aligned} \text{Lower bound} &= 19,798 - (2)(19,798)(.124) = \\ &19,798 - 4,910 = 14,888 \end{aligned}$$

$$\begin{aligned} \text{Upper bound} &= 19,798 + (2)(19,798)(.124) = \\ &19,798 + 4,910 = 24,708 \end{aligned}$$

1994

TABLE 16. Approximate design effects - Waves 1 and 2 data

Geography	Theme					
	2		7		Others	
Wave	1	2*	1	2*	1	2*
Canada	14.3		2.6		3.4	
Newfoundland	1.8		1.3		1.7	
Prince Edward Island	1.6		1.6		1.8	
Nova Scotia	3.0		2.2		2.9	
New Brunswick	2.9		1.9		1.5	
Quebec	6.8		3.1		3.1	
Ontario	8.5		2.2		3.1	
Manitoba	3.9		2.5		2.7	
Saskatchewan	1.9		1.5		1.4	
Alberta	3.8		1.7		1.8	
British Columbia	5.1		1.8		2.5	

* Design effects for Wave 2 will be available at a later date. Until then, the Wave 1 numbers may be used with Wave 2 data.

14**USING THE RECORD LAYOUT AND
THE DATA DICTIONARY**

The data dictionary, in electronic form and on paper, presents the complete information about each survey variable. For each variable are shown: the variable name, the description or definition, code lists with descriptions or alternatively the range of values that the variable can take on, the variable type, its length (or format), and the population to which the variable pertains, i.e. for whom it is applicable.

The electronic data dictionary is a menu-driven version of the data dictionary. For example, it allows the user to examine variables either by content theme or in alphabetical order. It is a good starting point for those unfamiliar with the survey content.

As described in the last section of Chapter 2, SLID supports both longitudinal and cross-sectional analysis, at both the person and job levels. This is enabled by the creation of four different types of public-use files:

- A *cross-sectional person file* for each year of data, having one record for each person in that year's cross-sectional sample (all in-scope persons in the longitudinal sample plus their cohabitants at the end of the reference year).

- A *longitudinal person file*, having one record for each person belonging to the longitudinal sample, and containing data relating to all years so far released for that panel.
- A *cross-sectional job file* for each year of data, having one record for each job (up to 6) held by each person in that year's cross-sectional sample (all in-scope persons in the longitudinal sample plus their cohabitants at the end of the reference year).
- A *longitudinal job file*, having one record for each job held by each person in the longitudinal sample, and containing data relating to all years so far released for that panel.

(The term “in-scope” means non-institutional and resident in one of the ten provinces at the end of the reference year.)

Each job file contains a subset of the variables on the corresponding person file. See Chapter 5, “Weights”, for information on the correct weight to use with each type of file.

1994

The approximate sizes of the public-use files for the Wave 2 release are indicated below:

File	Number of records	Number of variables	Record length (bytes)
1993 cross-sectional person file	29,650	304	1,008
1994 cross-sectional person file	29,632	304	1,008
Two-year longitudinal person file	27,854	835	2,768
1993 cross-sectional job file	22,522	217	513
1994 cross-sectional job file	23,629	217	513
Two-year longitudinal job file	28,271	388	888

The data dictionary shows which variables have been suppressed on the public-use file. On the internal file, these variables are available without suppression or modification. Therefore, users can specify their requirements for custom retrievals

using the same variable names. If they wish, they can most likely reduce the cost they pay for custom retrievals by writing their own programs which the survey staff would then execute against the internal file on their behalf. For more information on this, see Chapter 8, “Confidentiality of the Public-Use microdata”.

Both the data dictionary and the record layout are organized by content themes and in some cases sub-themes. The record layout columns are as follows:

Public-use file (PUF) variable name. This is the variable name assigned for the microdata file. It is a maximum of 8 bytes long and respects the variable-naming conventions of SAS. The numerals at or near the end of the variable name refer to the source table in the master SLID database. The lowercase letters at the end of some variable names refer to the different occurrences of the variable (see Occurrence, below). Excluding the lowercase letters at the end, the variable names will not change over time.

Type. Indicates whether the variable is numeric (in the sense that it can logically be used in mathematical operations) or character.

Start position and format. This shows the location of the variable on the public use file. The format shows both the length (the number of spaces including the decimal point if there are decimal places) and the number of decimal places, if any.

1994

For example, a variable which can have values of zero (00.0) to 99.9 would have a format expressed as: 4.1. A variable which can have values of zero (00) to 99 would have a format expressed as: 2.

Occurrence. For variables that are repeated (a, b, and so on), this column identifies the different instances of the variable. In most cases, the reason for multiple occurrences is to accommodate a different value for each year. For example, for Panel 1, province of residence has an occurrence for each year starting with December 31, 1992. Other examples:

- # marital states, where the occurrence column identifies *State 1, State 2, ... , State 6*, a chronological sequence of the marital states on record for that person;
- # information on certificates in the “Educational attainment” section, where the occurrence distinguishes between *Cert 1, Cert 2*, etc.

Long variable name. A standardized name, with a maximum of 26 characters, which can be used to quickly identify variables, to label tables, and so on. Although still rather cryptic, it is considerably more revealing than the variable name. However, this longer name obviously excludes a lot of important information contained in the variable description shown in the data dictionary. In short, analysts are warned against making assumptions about the variable definition based on the long variable name.

Number of categories. Shows the number of categories in the value set for the variable in question. Applies only to “character” variables. Numeric variables have ranges, which are specified in the data dictionary.

Reserved Codes

A brief explanation of reserved codes is provided below. For a more detailed explanation of reserved codes, see “Missing values and reserved codes” in Chapter 11, “Guidelines for Analysis and Presentation”.

6, 96, 9.6, etc.	Out of scope
7, 97, 9.7, etc.	“Don’t know” (the respondent did not have an answer, or the value was rejected during processing without being replaced)
8, 98, 9.8, etc.	Refusal (to the particular item in the questionnaire)
9, 99, 9.9, etc.	Not applicable

1994**Some “shorthand” notation**

The following are some of the commonly used abbreviations and acronyms:

Notation	Definition
2 (Y/N)	A 2-category “Yes/No” variable
ATAX	After tax
BTAX	Before tax
CA	Census agglomeration
CMA	Census metropolitan area
CSD	Census subdivision
EF	Economic family
EI	Employment Insurance
Flag	Sometimes used to describe a Yes/No variable
FT	Full time
FTE	Full time equivalents
FY	Full year
Gp	Original categories have been collapsed (grouped)
Lf	Labour force
LICO	Low income cut-off
Occ	Occupation
PT	Part time
Refyr (or rfyr or rfy)	Reference year
SA	Social assistance
WC	Workers’ Compensation
Y/M/D	Year/Month/Day
Yr or Y	Year

SLID DATA DICTIONARY, 1994

Sub-theme : IDENTIFIERS

PERSONID Character(12) Format: PPWFMMMMMMMM
Long variable name: Person ID
Description: Unique identifier for a person.

(Note. Suppressed on the public use file)

The format of this field is: PPWFMMMMMMMM

P - panel identifier
W - wave in which person entered sample
F - phase in which person entered sample
M - case identifier for person

Population: All persons

Reserved Codes: 999999999996 : Not in Sample
999999999997 : Don't Know
999999999998 : Refusal
999999999999 : Not Applicable

PUPRID26 Character(7)
Long variable name: Random person ID
Description: Public use unique person sequence number for the reference year.

Population: All persons

Reserved Codes: 9999996 : Not in Sample
9999997 : Don't Know
9999998 : Refusal
9999999 : Not Applicable

D31HH26 Character(12) Format: PPWFHHHHHHHH
Long variable name: Household ID
Description: Unique identifier for the household to which the respondent belonged as of December 31 of the reference year.

(Note. Suppressed on the public use file)

The format of this field is: PPWFHHHHHHHH

P - panel identifier
W - wave identifier
F - phase identifier
H - case identifier for household

Population: All persons

Reserved Codes: 999999999996 : Not in Sample
999999999997 : Don't Know
999999999998 : Refusal
999999999999 : Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : IDENTIFIERS

D31FAM26

Character(2)

Format: ff

Long variable name:

Economic family ID

Description:

Unique identifier, within a household, of the family to which the respondent belonged as of December 31 of the reference year.

(Note. Suppressed on the public use file)

The format of this field is: ff

f - unique family identifier within 1 household within a year

Population:

All persons

Range:

00:95

Reserved Codes:

96 :	Not in Sample
97 :	Don't Know
98 :	Refusal
99 :	Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : WEIGHTS

ILGWT26	Decimal(10.4)	Format: 99999.9999
<i>Long variable name:</i>	Int longitudinal weight	
<i>Description:</i>	Internal longitudinal weight for the person for the reference year.	
	This weight is suppressed on the public-use microdata file for confidentiality reasons. Weights sum to control totals of the population by province, age group and sex. For more information on weighting, see Section 5 of the SLID Microdata User's Guide.	
	(Note. Suppressed on the public use file)	
<i>Population:</i>	All persons	
<i>Range:</i>	00000.0000:99999.9999	
ELGWT26	Decimal(10.4)	Format: 99999.9999
<i>Long variable name:</i>	Ext longitudinal weight	
<i>Description:</i>	External longitudinal weight for the person for the reference year.	
	This weight should only be used for longitudinal estimates produced from the public-use microdata file.	
	Weights are modified so that households on the public-use file cannot be identified by virtue of the fact that they have identical weights. This is part of the confidentiality protection procedures applied to the public use file. Weights sum to control totals of the population by province, age group and sex. For more information on weighting, see Section 5 of the SLID Microdata User's Guide.	
	(Note. Values are perturbed on public use file)	
<i>Population:</i>	All persons	
<i>Range:</i>	00000.0000:99999.9999	
ICSWT26	Decimal(10.4)	Format: 99999.9999
<i>Long variable name:</i>	Int cross-sect weight	
<i>Description:</i>	Internal cross-sectional weight for the person for the reference year.	
	All persons within the same household at the end of the reference year will have the same value so this weight can also be used for estimates at the household and family levels.	
	This weight is suppressed on the public-use microdata file for confidentiality reasons. Weights sum to control totals of the population by province, age group and sex. For more information on weighting, see Section 5 of the SLID Microdata User's Guide.	
	(Note. Suppressed on the public use file)	
<i>Population:</i>	All persons	
<i>Range:</i>	00000.0000:99999.9999

<hr/>		
SSWT26	Decimal(10.4)	Format: 99999.9999
<i>Long variable name:</i>	Subsample weight	
<i>Description:</i>	Longitudinal subsample weight (used on public-use microdata file for one selected person per family, family members not selected will have a weight of 0.0).	
	This weight should be used for family level variables which have been subsampled on the public-use file.	
	Weights sum to control totals of the population by province, age group and sex. For more information on weighting, see Section 5 of the SLID Microdata User's Guide.	
<i>Population:</i>	Persons aged 16 or older	
<i>Range:</i>	00000.0000:99999.9999	

SLID DATA DICTIONARY, 1994

Sub-theme : RESPONSE CODES

RESP99	Character(2)
<i>Long variable name:</i>	Respondent status
<i>Description:</i>	Respondent status on December 31 of reference year.
	(Note. Suppressed on the public use file)
<i>Population:</i>	All persons
<i>Codes:</i>	01 : Longitudinal person - in scope
	02 : Longitudinal person - living in Yukon, NWT or continental U.S.A.
	03 : Longitudinal person - living outside Canada and continental U.S.A.
	05 : Longitudinal person - institutionalized for more than six months
	06 : Longitudinal person - deceased
	07 : Longitudinal person - dropped from sample (hard refusal, unable to trace, etc.)
	11 : Cohabitant - living with a longitudinal person at the end of the reference year and living in one of the ten Canadian provinces
	12 : Cohabitant - lived with a longitudinal person during the reference year, but was not at the end of the reference year
	13 : Cohabitant - living with a longitudinal person at the end of the reference year, but outside the ten Canadian provinces
	15 : Cohabitant - lived with a longitudinal person during the reference year, institutionalized for more than six months at the end of the reference year
	16 : Cohabitant - lived with a longitudinal person during the reference year, dead at the end of the reference year
	21 : Cohabitant - did not live with a longitudinal person at any time during the reference year (Joiner in May phase of collection year)
	22 : Cohabitant - did not live with a longitudinal person at any time during the reference year (Cohabitant of cohabitant)
	25 : Cohabitant - did not live with a longitudinal person at any time during the reference year (institutionalized for more than six months at end of reference year)
	26 : Cohabitant - did not live with a longitudinal person at any time during the reference year (dead at end of reference year)
	37 : Cohabitant - dropped from sample (hard refusal, unable to trace, etc.)
	51 : Top-up person - in scope

SLID DATA DICTIONARY, 1994

Sub-theme : RESPONSE CODES

<i>Codes:</i>	52 :	Top-up person - living in Yukon, NWT or continental U.S.A.
	53 :	Top-up person - living outside Canada and continental U.S.A.
	55 :	Top-up person - institutionalized for more than six months
	56 :	Top-up person - deceased
	57 :	Top-up person - dropped from sample (hard refusal, unable to trace, etc.)
	61 :	Top-up cohabitant - living with a top-up person at the end of the reference year and living in one of the ten Canadian provinces
	62 :	Top-up cohabitant - lived with a top-up person during the reference year, but was not at the end of the reference year
	63 :	Top-up cohabitant - living with a top-up person at the end of the reference year, but outside the ten Canadian provinces
	71 :	Top-up cohabitant - did not live with a top-up person at any time during the reference year (Joiner in May phase of collection year)
	72 :	Top-up cohabitant - did not live with a top-up person at any time during the reference year (cohabitant of top-up cohabitant)

LGPUF99

Character(1)

Long variable name:

Longitudinal PUF status

Description:

Longitudinal Public Use File status. The flag indicates if a record should be created on the longitudinal public-use microdata file for the current reference year. For created records, variables SAMP99 and M1SAMP99 to M6SAMP99 are used to initialize values on the public-use file.

(Note. Suppressed on the public use file)

Population:

All persons

Codes:

1 : Record should be created for this person on longitudinal Public Use File

2 : Record should not be created for this person on longitudinal Public Use File

Reserved Codes:

6 : Not in Sample

7 : Don't Know

8 : Refusal

9 : Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : RESPONSE CODES

CSPUF99 Character(1)
Long variable name: Cross-sect PUF status
Description: Cross-sectional Public Use File status. The flag indicates if a record should be created on the cross-sectional public-use microdata file for the current reference year. For created records, variables SAMP99 and M1SAMP99 to M6SAMP99 are used to initialize values on the public-use file.

(Note. Suppressed on the public use file)
Population: All persons
Codes:
1 : Record should be created for this person on cross-sectional Public Use File
2 : Record should not be created for this person on cross-sectional Public Use File
Reserved Codes:
6 : Not in Sample
7 : Don't Know
8 : Refusal
9 : Not Applicable

SAMP99 Character(1)
Long variable name: Sample status refyr
Description: Sample status for reference year. This variable is used when creating the public-use microdata file to initialize variables for the reference year. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)
Population: All persons
Codes:
1 : Person was in SLID sample
2 : Person was not in SLID sample
Reserved Codes:
6 : Not in Sample
7 : Don't Know
8 : Refusal
9 : Not Applicable

M1SAMP99 Character(1)
Long variable name: Sample status refyr-1
Description: Sample status for reference year minus 1. This variable is used when creating the public-use microdata file to initialize variables for the reference year minus 1. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)
Population: All persons

SLID DATA DICTIONARY, 1994

Sub-theme : RESPONSE CODES

<i>Codes:</i>	1 :	Person was in SLID sample
	2 :	Person was not in SLID sample
<i>Reserved Codes:</i>	6 :	Not in Sample
	7 :	Don't Know
	8 :	Refusal
	9 :	Not Applicable

M2SAMP99

Character(1)

Long variable name: Sample status refyr-2

Description: Sample status for reference year minus 2. This variable is used when creating the public-use microdata file to initialize variables for the reference year minus 2. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)

Population: All persons

<i>Codes:</i>	1 :	Person was in SLID sample
	2 :	Person was not in SLID sample
<i>Reserved Codes:</i>	6 :	Not in Sample
	7 :	Don't Know
	8 :	Refusal
	9 :	Not Applicable

M3SAMP99

Character(1)

Long variable name: Sample status refyr-3

Description: Sample status for reference year minus 3. This variable is used when creating the public-use microdata file to initialize variables for the reference year minus 3. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)

Population: All persons

<i>Codes:</i>	1 :	Person was in SLID sample
	2 :	Person was not in SLID sample
<i>Reserved Codes:</i>	6 :	Not in Sample
	7 :	Don't Know
	8 :	Refusal
	9 :	Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : RESPONSE CODES

M4SAMP99 Character(1)
Long variable name: Sample status refyr-4
Description: Sample status for reference year minus 4. This variable is used when creating the public-use microdata file to initialize variables for the reference year minus 4. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)

Population: All persons

Codes:

1 :	Person was in SLID sample
2 :	Person was not in SLID sample

Reserved Codes:

6 :	Not in Sample
7 :	Don't Know
8 :	Refusal
9 :	Not Applicable

M5SAMP99 Character(1)
Long variable name: Sample status refyr-5
Description: Sample status for reference year minus 5. This variable is used when creating the public-use microdata file to initialize variables for the reference year minus 5. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)

Population: All persons

Codes:

1 :	Person was in SLID sample
2 :	Person was not in SLID sample

Reserved Codes:

6 :	Not in Sample
7 :	Don't Know
8 :	Refusal
9 :	Not Applicable

M6SAMP99 Character(1)
Long variable name: Sample status refyr-6
Description: Sample status for reference year minus 6. This variable is used when creating the public-use microdata file to initialize variables for the reference year minus 6. If the flag value is '1', then all variables should be assigned a "Not Applicable" code. If the flag value is '2', then all variables should be assigned a "Not in Sample" code. Once the initial values have been assigned, a match to the appropriate entity is made. If a match is found, the initial value is overwritten.

(Note. Suppressed on the public use file)

Population: All persons

	8 :	Refusal
	9 :	Not Applicable

LGWTF26

Character(1)

Long variable name: Longitudinal weight flag

Description: Flag indicating if the person is eligible for longitudinal weighting for the reference year.

Note: People who are eligible (in scope) but who did not respond to the interview (labour AND income) have their flag set to "1" but a weight (LGWTF26) set to zero.

(Note. Suppressed on the public use file)

Population: All persons

<i>Codes:</i>	1 :	Yes
	2 :	No
<i>Reserved Codes:</i>	6 :	Not in Sample
	7 :	Don't Know
	8 :	Refusal
	9 :	Not Applicable

CSWTF26

Character(1)

Long variable name: Cross-sectional wght flag

Description: Flag indicating if the person is eligible for cross-sectional weighting for the reference year.

Note: People who are eligible (in scope) but who did not respond to the interview (labour AND income) have their flag set to "1" but a weight (CSWTF26) set to zero.

(Note. Suppressed on the public use file)

Population: All persons

<i>Codes:</i>	1 :	Yes
	2 :	No
<i>Reserved Codes:</i>	6 :	Not in Sample
	7 :	Don't Know
	8 :	Refusal
	9 :	Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : RESPONSE CODES

FANST26	Character(2)
<i>Long variable name:</i>	Final annual resp. code
<i>Description:</i>	Final annual response code for the person for the reference year. The annual response code is a combination of the response codes for the January and May phases.
	First byte:
	1=Complete
	2=Partial
	3=Non-response
	4=Not eligible
	(Note. Suppressed on the public use file)
<i>Population:</i>	All persons
<i>Codes:</i>	11 : Labour complete, Income complete
	22 : Labour complete, Income partial
	23 : Labour partial, Income complete
	24 : Labour partial, Income partial
	25 : Labour complete, Income non-response
	26 : Labour partial, Income non-response
	27 : Labour non-response, Income complete
	28 : Labour non-response, Income partial
	39 : Labour non-response, Income non-response
	40 : Not eligible
<i>Reserved Codes:</i>	96 : Not in Sample
	97 : Don't Know
	98 : Refusal
	99 : Not Applicable

FANST25	Character(1)
<i>Long variable name:</i>	Annual hhld response code
<i>Description:</i>	Final annual response code based on the household composition as of December 31 of the reference year. The annual response code is a combination of the final response codes for all members of a household.
<i>Population:</i>	All persons
<i>Codes:</i>	1 : Complete - every member of the household responds (completely or partially) to either the labour or the income interview or both
	2 : Partial - at least one member of the household, but not all, is a complete non-respondent to both the labour and the income interview
	3 : Non-response - all members of the household are complete non-respondents to both the labour and income interviews
	4 : Not eligible - every member of the household is not eligible
<i>Reserved Codes:</i>	6 : Not in Sample

MARST26	Character(2)	
<i>Long variable name:</i>	Marital status refyr (grp)	
<i>Description:</i>	Marital status of person as of December 31 of the reference year.	
<i>Population:</i>	Persons aged 15 or older	
<i>Codes:</i>	01 :	Married
	02 :	Common-law
	03 :	Separated
	04 :	Divorced
	05 :	Widowed
	06 :	Single (never married)
<i>Reserved Codes:</i>	96 :	Not in Sample
	97 :	Don't Know
	98 :	Refusal
	99 :	Not Applicable

DTFMAR26	Date(8)	Format: YYYYMMDD
<i>Long variable name:</i>	Date of 1st marriage	
<i>Description:</i>	Date of person's first marriage.	

All SLID "date" type variables can be viewed as a concatenation of the three sub-component fields year, month and day. The standard SLID reserved values are assigned, when necessary, to the component fields, and not to the complete date variable. So it is possible to have a mixture of valid values and reserved codes in a "date" type variable.

(Note. Suppressed on the public use file)

<i>Population:</i>	Persons aged 15 and older AND have been married	
<i>Range:</i>	18000101:99951231

8 : Refusal
9 : Not Applicable

MARMO26 Character(1)
Long variable name: Married more than once
Description: Flag indicating if person has been married more than once as of the end of the reference year.
Population: Persons aged 15 or older AND was married more than once
Codes: 1 : Yes
2 : No
Reserved Codes: 6 : Not in Sample
7 : Don't Know
8 : Refusal
9 : Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : DEMOGRAPHICS - MARITAL STATUS

STATE4	Character(2)
<i>Long variable name:</i>	Marital history
<i>Description:</i>	Marital status of respondent. The first state for all persons, (i.e. STATEID = 01) is always 06 = "Single (never married)".
	Persons separated from a common-law relationship are included in 03 = "Separated".
<i>Population:</i>	Persons aged 15 or older
<i>Codes:</i>	01 : Married
	02 : Common-law
	03 : Separated
	04 : Divorced
	05 : Widowed
	06 : Single (never married)
<i>Reserved Codes:</i>	96 : Not in Sample
	97 : Don't Know
	98 : Refusal
	99 : Not Applicable

STRDAT4	Date(8)	Format: YYYYMMDD
<i>Long variable name:</i>	Start date marital state	
<i>Description:</i>	Date on which the marital state began.	
	All SLID "date" type variables can be viewed as a concatenation of the three sub-component fields year, month and day. The standard SLID reserved values are assigned, when necessary, to the component fields, and not to the complete date variable. So it is possible to have a mixture of valid values and reserved codes in a "date" type variable.	
	(Note. Month and day suppressed on the public use file)	
<i>Population:</i>	Persons aged 15 or older

SLID DATA DICTIONARY, 1994

Sub-theme : WORK EXPERIENCE

YRXFTE11

Numeric(2)

Long variable name:

Yrs work experience(FYFTE)

Description:

Number of years of work experience (full-year full-time equivalents).
Definition includes all work (part-time and full-time) since first starting to work full time. A value of zero is given for people with less than a year of experience and for those who never worked full-time.

(Note. This information is not available for persons 70 years of age or older for reference years prior to 1995)

Population:

Persons aged 15 or older

Range:

00:95

Reserved Codes:

96 :	Not in Sample
97 :	Don't Know
98 :	Refusal
99 :	Not Applicable

SLID DATA DICTIONARY, 1994

Sub-theme : JOBLESS PERIODS

SPELLID	Numeric(2)
<i>Long variable name:</i>	Jobless spell ID
<i>Description:</i>	Unique jobless spell identifier for one person.
	(Note. Suppressed on the public use file)
<i>Population:</i>	Persons aged 16-69 AND had a jobless spell
<i>Range:</i>	00:95
<i>Reserved Codes:</i>	96 : Not in Sample
	97 : Don't Know
	98 : Refusal
	99 : Not Applicable

STRDAT7	Date(8)	Format: YYYYMMDD
<i>Long variable name:</i>	Start date jobless spell	
<i>Description:</i>	Start date of jobless spell. The jobless spell may span more than one reference year.	
	All SLID "date" type variables can be viewed as a concatenation of the three sub-component fields year, month and day. The standard SLID reserved values are assigned, when necessary, to the component fields, and not to the complete date variable. So it is possible to have a mixture of valid values and reserved codes in a "date" type variable.	
	(Note. Day suppressed on the public use file)

99 :	Not Applicable

IMPHWS1 Decimal(6.2) Format: \$999.99

Long variable name: Strt hrly wagherate in rfyr

Description: Implicit hourly wage for this job at start of reference year. A paid worker job with zero paid hours has a "Not Applicable" value. Value is also "Not Applicable" if job started during the reference year.

Population: Persons aged 16-69 AND had a job during the reference year AND paid worker

SLID DATA DICTIONARY, 1994

Sub-theme : JOB CHARACTERISTICS - WAGES AND BENEFITS

<i>Range:</i>	000.00:999.95	
<i>Reserved Codes:</i>	999.96 :	Not in Sample
	999.97 :	Don't Know
	999.98 :	Refusal
	999.99 :	Not Applicable

IMPHWE1	Decimal(6.2)	Format: \$999.99
<i>Long variable name:</i>	End hrly wagherate in refyr	
<i>Description:</i>	Implicit hourly wage for this job at end of reference year or end of employment spell for this job. A paid worker job with zero paid hours has a "Not Applicable" value. If wage rate reported in labour interview was not hourly, IMPHWE1 is derived from TOTHRP1 in conjunction with TOTEAR1. If necessary, IMPHWE1 is imputed using mean value from all records with similar industry group, age group, sex and province of residence group.	
<i>Population:</i>	Persons aged 16-69 AND had a job during the reference year AND paid worker	
<i>Range:</i>	000.00:999.95	
<i>Reserved Codes:</i>	999.96 :	Not in Sample
	999.97 :	Don't Know
	999.98 :	Refusal
	999.99 :	Not Applicable

TOTEAR1	Decimal(9.2)	
<i>Long variable name:</i>	Total earnings job refyr	
<i>Description:</i>	Total earnings from this job in reference year. The amount includes tips, bonuses and commissions. Regardless of what was reported in the labour interview, total earnings is re-calculated using IMPHWE1 and TOTHRP1 (also IMPHWS1 if there was a wage change and the month in which it occurred is known). Where required, TOTEAR1 may be imputed using annual wages and salaries (from income interview), provided only one paid worker job was reported.	
<i>Population:</i>	Persons aged 16-69 AND had a job during the reference year AND paid worker	
<i>Range:</i>	000000.00:999999.95	
<i>Reserved Codes:</i>	999999.96 :	Not in Sample

SLID DATA DICTIONARY, 1994

Sub-theme : JOB CHARACTERISTICS - ABSENCES FROM WORK

ABSCID Numeric(2)

Long variable name: Absence identifier

Description: Unique identifier for an absence from a job or employment spell with an employer. Paid vacation is not considered an absence. The same absence spell that crosses over two reference years should retain the same "abscid". Two distinct absence spells within the same employment spell would each have a distinct "abscid". Two concurrent absences with different employers would each have a distinct "abscid".

(Note. Suppressed on the public use file)

Population: Persons aged 16-69 AND had a job during the survey reference period AND absent in reference year

Range: 00:95

Reserved Codes:

96 :	Not in Sample
97 :	Don't Know
98 :	Refusal
99 :	Not Applicable

STRDAT8 Date(8) Format: YYYYMMDD

Long variable name: Start date abs. spell

Description: Start date of absence spell. The absence spell may span more than one reference year.

All SLID "date" type variables can be viewed as a concatenation of the three sub-component fields year, month and day. The standard SLID reserved values are assigned, when necessary, to the component fields, and not to the complete date variable. So it is possible to have a mixture of valid values and reserved codes in a "date" type variable.

(Note. Day suppressed on the public use file)

Population: Persons aged 16-69 AND had a job during the survey ref. period AND paid worker for that job AND not on-call schedule AND absent for 1 week or longer excl. paid vacation

Range: 18000101:99951231

Reserved Codes:
