Highlights

- Canadian households spent almost the same amount on food in 2001 as in 1996 according to new data from the Food Expenditure Survey; but our growing preference for eating out during this five-year period has changed how we spend our food dollar.
- In 2001, households spent an average of \$124 a week on food in either stores or restaurants, an amount similar to five years earlier when inflation is taken into account.
- Of every dollar Canadian households spent on food in 2001, 30 cents went to restaurant meals, up from 28 cents five years earlier. The share spent in stores declined correspondingly, from 72 cents of every dollar in 1996 to 70 cents in 2001. Twenty years earlier, in 1982, restaurant spending accounted for 25 cents out of every dollar spent on food.
- In 2001, households spent an average of almost \$38 a week in restaurants and \$86 on food purchased in stores.

All income groups dined out

- Weekly spending on food ranged from an average of \$66 for households with incomes less than \$20,000, up to \$203 for households with incomes of \$80,000 or more.
- Well over half of households in the lowest income group consist of individuals living alone, compared with less than 10% of households in the highest income group.
- Individuals in the lowest household income group spent an average of \$39 a week per person on food, compared with \$59 a week for those in the highest income group.
- Individuals in the highest income group purchased meals from restaurants an average of twice a week compared to once a week for those in the lowest income group.

It's all about convenience

- The proportion of the household food dollar spent in stores on 'other foods, materials and food preparations' increased from about six cents in 1982 to almost ten cents in 2001. The average expenditure on this category in 2001 was an estimated \$8 per week.
- In 2001, frozen pre-cooked dinners and baked goods accounted for 31 cents of every dollar spent on 'other foods, materials and food preparations'. That compares with 26 cents in 1996.
- More households than ever before are buying yogurt. The percentage of households that purchased yogurt jumped from 9% in 1996 to 22% in 2001.

Food spending increases east to west

- Across Canada, weekly food spending ranged from \$109 on average in the Atlantic provinces to \$132 in British Columbia.
- In 2001, British Columbian households spent 33 cents of every food dollar dining out – three percentage points above the Canadian average. By contrast, households in the Atlantic provinces allocated 25 cents of every food dollar to restaurant meals. In 1996, spending in restaurants showed a similar pattern, with British Columbian households spending 32 cents of every food dollar on restaurant food compared to an average of 23 cents for Atlantic households.

Introduction

About the Food Expenditure Survey

This publication contains information collected via the Food Expenditure Survey in 2001 which was carried out in the 10 provinces of Canada, as well as Whitehorse, Yellowknife and Iqaluit. Throughout 2001, households were asked to record, in detail, their expenditures on food for a period of two weeks.

The Food Expenditure Survey is a companion of the Survey of Household Spending which provides detailed information on all household expenditures, but only an overall estimate for food. The 2001 Survey of Household Spending was conducted in January, February and March 2002. Data availability was announced in December 2002. The results will be published in Summer 2003, in "**Spending Patterns in Canada, 2001**", Catalogue number 62-202.

Seventeen food expenditure surveys have been carried out since 1953 (including the 2001 survey). Starting in 1972, they were conducted approximately every two years. Coverage for most of these surveys has been restricted to selected cities. Only five of the previous food expenditure surveys have also included smaller urban and rural areas to provide national coverage for the 10 provinces: 1969, 1982, 1986, 1992, and 1996.

The primary reason for collecting food expenditure data is to monitor and periodically update the weights used in the computation of the Consumer Price Index (CPI). In addition to this, food expenditure data classified by variables such as income, household type and province, provide the basis for a variety of analytical investigations of the food purchasing habits of households in Canada. For example, the survey data are used for market analysis and nutritional studies.

About this Publication

Information in this publication is organized in the following manner:

- The section entitled *Analysis* presents an article based on data from the Food Expenditure Survey.
- Two historical tables are presented. The first includes data for Canada for the years 1982, 1986, 1992, 1996 and 2001. The second includes data by Region for 1996 and 2001.
- *Survey Results* presents data tabulated by regions, income groups, metropolitan areas, various types of households, and size of area of residence (urban/rural).

- The *Notes and Definitions* section contains information of interest to data users such as a description of the survey methodology, data quality information and definitions of survey terms.
- *How to Use the Statistical Tables* contains important information about manipulating the data in the tables. For example, the correct way to combine columns of data or create custom estimates is explained.

Analysis

Canadian households spent almost the same amount on food in 2001 as in 1996 according to new data from the Food Expenditure Survey; but our growing preference for eating out during this five-year period has changed how we spend our food dollar.

In 2001, households spent an average of \$124 a week on food in either stores or restaurants, an amount similar to five years earlier when inflation is taken into account.

Of every dollar Canadian households spent on food in 2001, 30 cents went to restaurant meals, up from 28 cents five years earlier. The share spent in stores declined correspondingly, from 72 cents of every dollar in 1996 to 70 cents in 2001. Twenty years earlier, in 1982, restaurant spending accounted for 25 cents out of every dollar spent on food.

In 2001, households spent an average of almost \$38 a week in restaurants and \$86 on food purchased in stores.

Table 1
Percentage of Total Weekly Food Expenditure per Household

	1982	1986	1992	1996	2001
	%				
Total food	100	100	100	100	100
Food purchased from restaurants	25	27	30	28	30
Food purchased from stores	75	73	70	72	70

Table 2
Average Weekly Expenditure per Household (constant dollars)

	1982	1986	1992	1996	2001
	constant dollars				
Total food	120	128	130	124	124
Food purchased from restaurants	35	39	39	34	38
Food purchased from stores	85	89	90	90	86

In 2001, almost 60% of restaurant spending took place in table-service restaurants, compared to 26% in fast-food restaurants (including take-out) and less than 10% each in cafeterias and other types of restaurants such as snack bars and chip wagons.

More than 80 cents of every food dollar spent in stores in 2001 was spent in a supermarket. Specialty food stores, convenience stores and other types of stores such as department stores or drug stores were well behind, with less than 10 cents each of that dollar.

Couples with kids spent most on food; single men preferred eating out

Table 3
Percentage of Total Weekly Food Expenditure for Selected Types of Households, 2001

	Percentage spent in restaurants	Percentage spent in stores	Average weekly expenditure per household
	%	%	\$
All households	30	70	124
One-person	35	65	66
Male	40	60	72
65 and over	38	62	60
Female	31	69	62
65 and over	23	77	55
All couples	29	71	153
Couple without children	32	68	122
Couple with children ¹	28	72	171
Couple, both 65 and over	26	74	115
Lone-parent	29	71	103
Female-headed	27	73	99

¹ Children of any age who are single (never-married); includes foster children.

Not surprisingly, couples with children spent the highest amount each week on total food purchases. Men who lived alone spent the highest proportion of their food budget in restaurants.

The survey showed that a couple with at least one child spent on average \$171 a week on food purchases in 2001. Of every dollar families spent on food, 28 cents went to restaurant meals, while 72 cents went to stores. That compares with a 25 cents and 75 cents respectively in 1996.

On the other hand, men living alone spent just under \$72 a week on food in 2001. They spent 40 cents of every dollar in restaurants and 60 cents in stores, not significantly different from 1996.

Lone-parent families headed by a woman spent an average of \$99 a week on food. They, too, were eating out more, spending 27 cents of every food dollar in restaurants, up from 22 cents five years earlier.

Restaurant spending covers meals in table-service, fast-food or cafeteria style establishments, and also take-out food or snacks from snack bars, vending machines and chip wagons.

All income groups dined out more

Weekly spending on food ranged from an average of \$66 for households with incomes less than \$20,000, up to \$203 for households with incomes of \$80,000 or more.

Well over half of households in the lowest income group consist of individuals living alone, compared with less than 10% of households in the highest income group. To improve comparisons between lowest and highest income households, expenditures can also be expressed on a per person basis.

Individuals in the lowest household income group spent an average of \$39 a week per person on food, compared with \$59 a week for those in the highest income group. Those in the lowest income group spent 23 cents of their food dollar on restaurant meals and 77 cents in stores. By contrast, those in the highest income group spent 36 cents on the dollar in restaurants and 64 cents in stores.

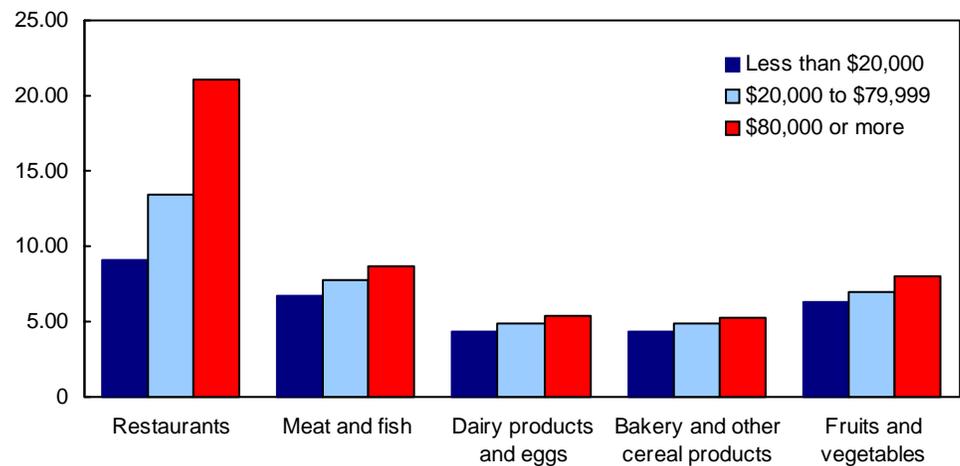

Individuals in the highest income group purchased meals from restaurants an average of twice a week compared to once a week for those in the lowest income group.

The proportion of the food budget spent in stores for each food category was similar in every income group.

Graph 1

Average Weekly Expenditure per Person on Restaurants and Four Main Food Categories by Household Income Group

Average weekly \$

It's all about convenience

The proportion of the household food dollar spent in stores on 'other foods, materials and food preparations' increased from about six cents in 1982 to almost ten cents in 2001. The average expenditure on this category in 2001 was an estimated \$8 per week. This category includes a wide variety of items, from frozen pre-cooked dinners and baked goods, to peanut butter, potato chips, soups and baby foods.

In 2001, frozen pre-cooked dinners and baked goods accounted for 31 cents of every dollar spent on 'other foods, materials and food preparations'. That compares with 26 cents in 1996.

Households devoted an estimated 20 cents of every food dollar spent in stores to meat in 2001 (\$17 a week on average), down from 22 cents in 1996 and 27 cents in 1982. Of every dollar spent on meat in 2001, 30 cents went to beef, 24 cents went to poultry and 15 cents went to pork, veal or lamb. Approximately 31 cents

Table 4
Percentage of Weekly Food Expenditure Spent in Stores, 1982, 1996 and 2001

went to other meats and meat preparations such as cold cuts, sausages, and ready-cooked meats. Only 38% of households reported buying beef in 2001, compared with 43% of households in 1996.

In 2001, households in Canada spent an estimated average of \$13 a week on dairy products and eggs. This category accounts for a smaller share of the food store budget, down from 18 cents on the dollar in 1982 to 15 cents by 2001.

More households than ever before are buying yogurt. The percentage of households that purchased yogurt jumped from 9% in 1996 to 22% in 2001.

Food spending increases east to west

Across Canada, weekly food spending ranged from \$109 on average in the Atlantic provinces to \$132 in British Columbia.

In 2001, British Columbian households spent 33 cents of every food dollar dining out – three percentage points above the Canadian average. By contrast, households in the Atlantic Provinces allocated 25 cents of every food dollar to restaurant meals. In 1996, spending in restaurants showed a similar pattern, with British Columbian households spending 32 cents of every food dollar on restaurant food compared to an average of 23 cents for Atlantic households.

Households in Atlantic Canada devoted the highest proportion of their food expenditures in stores to meat in 2001, at 21 cents on the dollar. British Columbians allocated the provincial low of 17 cents, approximately three percentage points below the national average. In 1996, this pattern was similar.

Notes and Definitions

Survey Methodology

The Survey Universe

The 2001 Food Expenditure Survey was carried out in private households residing in urban and rural areas in Canada's ten provinces as well as in the cities of Whitehorse, Yellowknife and Iqaluit. The survey covers about 98% of the population in the 10 provinces.

The following groups were excluded from the survey:

- those living on Indian reserves and crown lands;
- official representatives of foreign countries living in Canada and their families;
- members of religious and other communal colonies;
- members of the Canadian Armed Forces living in Military Camps;
- people living in residences for senior citizens;
- people living full time in institutions: for example, inmates of penal institutions and chronic care patients living in hospitals and nursing homes.

Information was not gathered from persons temporarily living away from their families (for example, students at university), because it would be gathered from their families if selected. In this way, double counting of such individuals was avoided.

Furthermore, for operational reasons, households residing in dwellings located in remote areas were excluded from the 2001 Food Expenditure Survey. These households represent less than 1% of the population described above but are difficult and expensive to contact.

Survey Content and Reference Period

The Food Expenditure Survey is a periodic survey carried out every 4 or 5 years. It is designed to supplement the Survey of Household Spending (SHS)¹ by providing a level of expenditure detail on food commodities not feasible in the context of the SHS methodology. Data from the 2001 Food Expenditure Survey and the Survey of Household Spending are used to update the weights used in the calculation of the Consumer Price Index.

The Sample

The sample size for the 2001 Food Expenditure Survey was 9,488 dwellings.

¹ The SHS is an annual survey that asks respondents to recall all expenditures made during the most recent calendar year. The results of the SHS are published in *Spending Patterns in Canada*, catalogue number 62-202.

This sample was a stratified, multi-stage sample selected from the Labour Force Survey (LFS) sampling frame. Sample selection comprised two main steps: the selection of clusters (small geographic areas) from the LFS frame and the selection of dwellings within these selected clusters. The LFS sampling frame mainly uses 1991 Census geography and 1991 population counts.²

The sample was drawn for the whole year and then divided into monthly subsamples to evenly distribute data collection over the entire 2001 calendar year. This ensures that we get an accurate picture of food expenditures regardless of the season.

Data Collection

The Food Expenditure Survey was conducted monthly during the 2001 calendar year. Data were collected by an interviewer by means of a personal interview using a paper questionnaire (FE2). Two weekly diaries (FE3) were also left for the respondent to complete daily for two consecutive weeks.

The questionnaire was used primarily to collect selected socioeconomic characteristics (including income), as well as information on the household's purchasing habits and food expenditures if away from home during the previous month. Following the interview, respondents were asked to maintain a daily record of all food expenditures (excluding those while on a trip overnight or longer) using two one-week diaries. Respondents were asked to provide detailed descriptions of daily food purchases including type of packaging (frozen, canned, dried, other), number of units purchased, weight or volume per unit (in either metric or imperial measure), the total cost of the purchase and whether purchased from a food speciality store, convenience store, supermarket or other store. In 2001 respondents were asked to attach their grocery store receipts to the diaries so that the processing staff could identify certain food commodities or find unreported weights.

For meals and snacks in restaurants, the type of meal (breakfast, lunch, dinner, between-meals food) was requested. Respondents were also asked to record the number of meals and total cost, and to indicate whether the meal had been purchased from a table-service restaurant, fast-food restaurant, cafeteria or other restaurant.

At the end of each one-week recording period, interviewers were required to return to the respondent's home to pick-up and review the previous week's diary for completeness and accuracy. At the same time, information was collected on items which might have influenced the previous week's purchasing pattern and level of expenditure such as household member absences during the week, number of meals served to guests or other non-household members, free meals received, food received as gifts or home-produced, food from hunting or fishing.

Data Processing and Quality Control

Processing

Processing consisted of:

1. Reviewing the questionnaires for missing information, for clarity and for errors.
2. Coding food commodities on the diaries according to approximately 210 different food codes. Coders also entered missing weights or volumes based on the price declared and the quantity purchased of the product.
3. Checking basic ranges for data fields during data entry.
4. Passing data through an editing system that included checking for missing data and verifying consistency between selected data fields.

² A detailed description of the Labour Force Survey sampling frame can be found in Methodology of the Canadian Labour Force Survey, *Statistics Canada; Catalogue No. 71-526-XPB*.

5. Reviewing and correcting extreme data values.
6. Imputing missing values using the nearest neighbour method or averages (only for expenditures on meals). Detailed food codes were assigned from donor records having similar characteristics (province, quarter of the year, similar costs, etc).
7. Tabulating expenditures using a PC/client server-based system. This system provides tools (database querying, searching, and viewing capabilities) for spotting systematic errors.

Quality Control

To maximize accuracy during the processing of the survey data, strict procedures for quality control were followed. Editing was carried out in stages. Preliminary edits, mainly for completeness, were done by the interviewers in the field.

Adjustment for Bias in Purchases from Stores

As in previous surveys, average expenditures and quantities for food purchased from stores locally and on day trips have been adjusted to allow for shortfalls in data reported on the diaries. An adjustment factor of 1.0827 has been applied to each expenditure and quantity item. See the section "Data Quality" for an explanation of the adjustment.

Response Rate

The overall response rate was 71.3%. In Technical Table 1, the sample response by region is summarized.

Technical Table 1
Response Rate by Region, 2001

	Eligible households	Non-contacts*	Refusals	Usables**	Response rate***
					%
Canada	8,414	978	1,437	5,999	71.3
Atlantic Region	856	70	105	681	79.6
Quebec	1,615	117	252	1,246	77.2
Ontario	2,404	349	450	1,605	66.8
Prairie Region	1,590	147	228	1,215	76.4
British Columbia	1,422	218	308	896	63.0
Whitehorse, Yellowknife and Iqaluit	527	77	94	356	67.6

* Non-contacts includes households where:
 Interview prevented by unusual circumstances (death, sickness, language, etc.)
 Interview prevented by weather conditions
 No-one home
 Household temporarily absent
 Interview cancelled for lack of an interviewer

** Usables includes households with both 1-week diaries completed as well as households with only one diary.

*** Usable divided by eligible *100.

Weighting

The estimation of population characteristics from a sample survey is based on the premise that each sampled unit represents a certain number of units in the population. A basic survey weight was attached to each record in the sample to reflect this representation.

These basic weights were adjusted for non-response by calendar quarter in each of 13 metropolitan areas, 18 additional geographic areas, and three high-income strata. The 18 additional geographical areas consist of regional groupings of the remaining metropolitan areas and urban and rural areas which are based on census definitions but do not necessarily correspond exactly. For definitions of *metropolitan area*, *urban* and *rural*, refer to the 1996 Census Dictionary, catalogue number 92-351-XPE.

To increase the reliability of the estimates, weights were also adjusted to ensure that estimates based on relevant characteristics of the population would respect population totals from sources other than the survey. These totals are based on demographic projections as of January 19, 2002 using the 1996 Census of Population (adjusted for net undercoverage).

Controls for six age groups combined with totals for one-person households, two-person households and more than two-person households are used at the regional level. There are also totals for the number of single-parent families and couples with never-married children that are also used at the regional level.

Controls for two age groups are used in 13 metropolitan areas plus Whitehorse. In addition to these two age groups, in Whitehorse the following controls are also used: counts of one-person households, two-person households and households with more than two persons. For Yellowknife and Iqaluit, only the total number of households is used.

All weekly records from a household received the same weight. Most households (95%) have two records – one for each weekly diary completed. However, 252 households completed only one diary and therefore have only one record.

Data Quality

Sampling Error

Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The sample design, the variability of the data, and the sample size determine the size of the sampling error. In addition, for a given sample design, different methods of estimation will result in different sampling errors.

The design for the 2001 Food Expenditure Survey was a stratified multi-stage sampling scheme. The sampling errors for multi-stage sampling are usually higher than for a simple random sample of the same size. However, the operational advantages outweigh this disadvantage and the fact that the sample is also stratified improves the precision of estimates.

Data variability is the difference between members of the population with respect to spending on a specific item. In general, the greater these differences are, the larger the sampling error will be. In addition, the larger the sample size, the smaller the sampling error.

Standard Error and Coefficient of Variation

A common measure of sampling error is the standard error (SE). Standard error is the degree of variation in the estimates as a result of selecting one particular sample rather than another of the same size and design. It has been shown that the “true” value of the characteristic of interest lies within a range of +/- 1 standard error of the estimate for 68% of all samples, and +/- 2 standard errors for 95% of all samples.

The coefficient of variation (CV) is the standard error expressed as a percentage of the estimate. It is used to indicate the degree of uncertainty associated with an estimate. For example, if the estimate of an average expenditure for a given category is \$75, and the corresponding CV is 5%, then the “true” value is between \$71.25 and \$78.75, 68% of the time and between \$67.50 and \$82.50, 95% of the time.

Standard errors for the 2001 Food Expenditure Survey were estimated using the jackknife technique, which leads to a slight over-estimation and is, thus, conservative. For more information, refer to the Statistics Canada publication (Catalogue 71-526-XPB), *Methodology of the Canadian Labour Force Survey*.

Coefficients of variation for summary expenditure estimates for Canada and the regions are presented in Technical Table 2 at the end of this report.

Data Suppression

For reliability reasons, estimates with CVs greater than 33% should be suppressed. To facilitate tabulation, data suppression for the Food Expenditure Survey is based on a relationship between the CV and the number of weekly records with a non-zero amount for an expenditure category. Analysis of past survey results indicates that CVs usually reach this level when the number of weekly records with a non-zero amount for an item drops to about 40. Therefore, average weekly expenditure and percentage reporting have been suppressed for spending on items reported in fewer than 40 weekly records.

However, data for suppressed items do contribute to summary level variables. For example, the expenditure for a particular category of meat might be suppressed but this amount forms part of the total expenditure estimate for meat.

Approximation of Coefficient of Variation

It is possible to approximate the CV of estimates not presented in Technical Table 2 using a relationship between the CV and the number of weekly records in which expenditures for an item were reported. Previous studies have shown that the CV of the estimate of an item tends to decrease in proportion to the square root of the number of weekly records with a non-zero amount for the item. As an example, according to Technical Table 2, the estimated CV for the average weekly household expenditure on food purchased from stores for all households is 0.80%.

To estimate the CV for the average weekly household expenditure on food purchased from stores for all households in the lowest income group from Table 2, use the following equation. Note that this method provides only an approximation of the CV.

CV for expenditures on food purchased from stores for all households in the lowest income group:

$$\begin{aligned}
 &= \text{CV (for all households)} \times \sqrt{\frac{\text{(\# of weekly records with a non-zero amount for the item)}}{\text{\# of weekly records with a non-zero amount for the item for lowest income group households)}} \\
 &= 1.04\% \times \sqrt{(10,140/1,756)} \\
 &= 1.04\% \times 2.40 \\
 &= 2.50\%
 \end{aligned}$$

where # of weekly records with a non-zero amount for the item

$$\begin{aligned}
 &= \frac{\text{\# of weekly records} \times \text{percentage reporting}}{100} \\
 &= \frac{11,034 \times 91.9}{100} \\
 &= 10,140
 \end{aligned}$$

and where # of weekly records with a non-zero amount for the item for lowest income group households

$$\begin{aligned}
 &= \frac{(\text{\# of weekly records with a non zero amount for hhlds in lowest income group} \times \text{percentage reporting for the households in the lowest income group})}{100} \\
 &= \frac{2,011 \times 87.3}{100} \\
 &= 1,756
 \end{aligned}$$

Non-sampling Error

Non-sampling errors occur because certain factors make it difficult to obtain accurate responses or responses that retain their accuracy throughout processing. Unlike sampling error, non-sampling error is not readily quantified. Four sources of non-sampling error can be identified: coverage error, response error, non-response error, and processing error.

Coverage Error

Coverage error results from inadequate representation of the intended population. This error may occur during sample design or selection, or during data collection and processing.

Response Error

Response error may be due to many factors, including design of the questionnaire, interviewers' or respondents' misinterpretation of questions, or inaccurate reporting. The diary method requires respondents to record their expenditures as they are made. Errors may arise, however, as respondents make transcription errors, use misleading terms for products, or guess, in the absence of price and quantity labels.

Several features of the survey aim to help respondents provide data as accurately as possible. Personal visits from the interviewer provide assistance on how to fill in the diaries. Sometimes the interviewer helps the respondent to fill in gaps in the data. In addition, for 2001, respondents were strongly encouraged to attach their store receipts to the diary page corresponding to the day of the purchase. The receipts provided additional information for processing staff. Also new for 2001 was the notebook. Every member of the household aged 8 years and over was given a small notebook to carry all day to facilitate the notation of products at the time of purchase.

Non-Response Error

Non-response error occurs in sample surveys because not all potential respondents cooperate fully. The extent of non-response varies from partial non-response to total non-response. The importance of the non-response error is unknown but in general this error is significant when a group of people with particular characteristics in common refuses to cooperate and where those characteristics are important determinants of survey results.

Total non-response occurs when the interviewer is unable to contact the respondent, no member of the household is able to provide information, or the respondent refuses to participate in the survey. Total non-response is handled by adjusting the basic survey weight for responding households to compensate for non-responding households. For the 2001 Food Expenditure Survey, the overall response rate is 71.3%. See Technical Table 1 for regional response rates.

In a survey conducted using a questionnaire, partial non-response occurs when the respondent does not understand or misinterprets a question, refuses to answer a question, or is unable to recall the requested information. When a diary is used, partial non-response occurs when the respondent does not enter complete information for each purchase. The Food Expenditure Survey uses both a questionnaire and a diary to collect data. Imputing missing values compensates for partial non-response.

In some cases the respondent may only partially cooperate in completing the survey. Some of the non-response error associated with partial cooperation is measurable by examining the difference between first week and second week diaries. For two-week reporters, average expenditure on food purchased from stores in the second week is 10% lower than in the first week.

Adjustment factor applied to values obtained from diary

During the questionnaire interview, respondents were asked to provide household expenditures on food purchased from stores during a four-week period. The estimate for expenditure on food purchased from stores that was obtained via the questionnaire was \$83.68 compared to an estimate of \$77.27 using only data from the diaries - a difference of 8.3%. On the assumption that the questionnaire estimate of food purchased from stores is more reliable than the corresponding diary estimate, values for food from stores purchased locally and on day trips from each household have been increased in proportion to the ratio of the two numbers ($\$83.68/\$77.27 = 1.083$).

While separate adjustment factors could have been applied to all subgroups of the population, in view of the underlying sampling and non-sampling errors, a single adjustment factor has been applied. No information is available neither to differentially adjust the commodity groups nor to indicate adjustments to the percentage reporting.

Adjustment factors of 1.158, 1.163, 1.137 and 1.152 were applied respectively to the 1996, 1992, 1990 and 1986 Food Expenditure Survey estimates. Since the estimates from surveys prior to 1986 were not adjusted to compensate for under-reporting of food purchased from stores, the following adjustment factors should be applied before making comparisons with 1986, 1990, 1992, 1996 or 2001 estimates:

1982 = 1.090

1984 = 1.117

Note that the above adjustment factors apply at the national level. Since some of the previous food expenditure surveys were conducted for selected cities only, the following adjustment factors should be used for city level comparisons: for 1982, 1986, 1992, 1996 and 2001 the factors are 1.125, 1.173, 1.175, 1.193 and 1.096 respectively.

No adjustments have been applied to the estimates of food expenditures in restaurants.

Processing Error

Processing errors may occur in any of the data processing stages, for example, during data entry, editing, weighting, and tabulation. See *Data Processing and Quality Control* for a description of the steps taken to reduce processing error.

Comparability over Time

Estimates from the 2001 Food Expenditure Survey have been produced using a different methodology from previous surveys.

The new methodology includes the use of control totals based on the 1996 Census of Population to replace those based on the 1991 Census. To facilitate comparisons, the 1996 food expenditure data have been reweighted using the new methodology. Contact Client Services at 1-888-297-7355 for more information or to obtain 1996 data tables with reweighted data.

Definitions

This section contains definitions of the terms and concepts used in this publication. They are grouped under the following headings:

- Selected Expenditure Terms
- Selected Household Characteristics
- Classification of Households
- Household Income
- Geographical Characteristics
- Classification of Food Purchases.

Selected Expenditure Terms

Item numbers: The detailed statistical tables in this publication include four-digit codes for each category of expenditure or characteristic shown in the stub. Where two or more basic classes have been aggregated, the code range shown defines the content of these aggregates. Note that these numbers are not necessarily the same from year to year.

Average weekly expenditure per household: This refers to the weighted sum of the weekly record values for each variable, divided by the weighted number of weekly records. These averages are based on **all** households in a class, **including** households that did not have expenditures in a given category.

The averages for different items in a column can be added together to provide new subtotals.

You cannot combine average expenditures across several columns by doing a simple addition of averages across rows. (See *How to use the Statistical Tables*.)

Percentage of households reporting: This refers to the percentage of weekly records in a given column with a non-zero amount for an expenditure category. Percentages for different items in a column cannot be added together to form subtotals.

Selected Household Characteristics

Household: A person or group of persons occupying one dwelling unit is defined as a "household". The number of households, therefore, equals the number of occupied dwellings. The person or persons occupying a private dwelling form a private household.

The unit of observation for food expenditure surveys prior to 1990 was the "spending unit" - a group of persons living in the same dwelling who depend on a common or pooled income for major expenses, or one financially independent individual living alone. This concept was abandoned in favour of "household" starting with the 1990 survey.

Reference person: The household member being interviewed chooses which household member should be listed as the reference person after hearing the following definition. The household reference person is “the member of the household mainly responsible for its financial maintenance (i.e., pays the rent, mortgage, property taxes or electricity, etc.). This person can be either male or female. In cases where members share equal financial responsibility, choose one to be the household reference person”.

Age: Age at time of interview.

Age of reference person: This variable acts as a general age indicator for the household and is calculated using the reference person’s age in years. Prior to 1996, the age of the husband was used for couple households and the age of the reference person for all other households.

Classification of Households

One-person households: The dwelling is occupied by only one person.

Couple households: Households where the married or common-law spouse of the reference person is a member of the household at the time of the interview.

This household type may be further broken down into couple households without children (without additional persons), with children (without additional persons) and with additional persons.

“Children” are never-married sons, daughters, or foster children of the reference person and may be any age. “Additional persons” include sons, daughters and foster children whose marital status is other than “single, never-married”, other relatives by birth or marriage, and unrelated persons.

Lone-parent households: Households where no spouse of the reference person is present and there is at least one child (never-married son, daughter, or foster child of the reference person). The lone-parent households for which data are presented in this publication do not include any additional persons.

Other households: May be broken down into households composed of relatives only and households having at least one unrelated person. Relatives may include:

- sons, daughters and foster children of the reference person whose marital status is other than “single, never-married”;
- relatives of the reference person by birth or marriage other than spouse, son, daughter, or foster child;

A household with at least one household member who is unrelated to the reference person (e.g., lodger, roommate, employee) is classified in *Other households, at least one person unrelated*.

Household Income

Household income: Income includes income from all sources before deductions for all household members during the preceding 12 months. For 2001, respondents were asked to indicate into which of 12 income groups their household income fell. In previous food expenditure surveys, there were detailed income questions for each household member 15 years of age and over. This allowed data to be tabulated by custom income group and income quintile. In order to reduce respondent burden, these detailed questions were removed.

Since the survey was conducted in monthly samples throughout 2001, income refers to varying periods ranging from approximately the calendar year 2000 for the January 2001 sample, to the calendar year 2001 for the December 2001 sample.

The following income groups are asked on the survey questionnaire:

Less than \$5,000
 \$5,000 to \$9,999
 \$10,000 to \$14,999
 \$15,000 to \$19,999
 \$20,000 to \$29,999
 \$30,000 to \$39,999
 \$40,000 to \$49,999
 \$50,000 to \$59,999
 \$60,000 to \$69,999
 \$70,000 to \$79,999
 \$80,000 to \$99,999
 \$100,000 or more

The following income groups are offered in this report:

Less than \$20,000
 \$20,000 to \$39,999
 \$40,000 to \$59,999
 \$60,000 to \$79,999
 \$80,000 or more
 Not stated

Geographical Characteristics

Metropolitan Areas: The overall concept for delineating metropolitan areas is one of a large urban area together with adjacent urban and rural areas that have a high degree of social and economic integration with this urban area. (See the *1996 Census Dictionary*, Catalogue no. 92-378-XPE.)

The metropolitan areas for which food expenditure data are tabulated in 2001 are Montreal, Toronto, Vancouver, Whitehorse and Yellowknife. Data for Whitehorse and Yellowknife are based on samples of less than 200 households. Special caution is necessary when using estimates from such small sub-groups. When making year-to-year comparisons, changes may not be statistically significant. Response rates in Toronto, Vancouver and Whitehorse were 57%, 57% and 59% respectively compared to 74% in Montreal and 82% in Yellowknife. Low response rates are likely to introduce bias into the estimates.

Region: Refers to groups of provinces as follows: Atlantic (Newfoundland and Labrador, Prince Edward Island, Nova Scotia and New Brunswick) and Prairies (Manitoba, Saskatchewan and Alberta). The provinces of Quebec, Ontario and British Columbia are also included in Table 1 so that all Canadian provinces are covered.

Urban Area: For the Food Expenditure Survey (based on the LFS sampling frame), urban areas include:

- all larger metropolitan areas (even though they do contain some rural areas);

- most smaller metropolitan areas (also called census agglomerations). In some cases, where a census agglomeration contains a large rural population, only the urban portion is considered urban;
- urban areas based on the census definition: Urban areas have minimum population concentrations of 1,000 and a population density of at least 400 per square kilometre, based on the previous census population counts.

Rural Area: All territory outside urban areas is considered as a rural area. Taken together, urban and rural areas cover all of Canada.

Size of area of residence: Sampled dwellings are assigned to the following groups depending on the 1996 population size (according to the 1996 census boundaries) of the metropolitan area, municipality or urban area in which they are located.

Households are assigned to the following groups:

- All rural
- All urban
- Urban under 30,000
- Urban 30,000 - 99,999
- Urban 100,000 - 249,999
- Urban 250,000 - 499,999
- Urban 500,000 - 999,999
- Urban 1,000,000 and over

Classification of Food Purchases

Food purchased from restaurants: Food purchased from restaurants is classified by meal type: breakfasts, lunches, dinners and snacks. Information on type of restaurant and number of meals was also collected.

Table-service restaurants: Restaurants, bars or pubs that serve food and beverages at a table or an eating counter. Note: this category should be indicated even if purchases are to be taken out or delivered.

Fast-food restaurants: have no table service. Instead the customers order the food at a counter and choose to 'eat-in' or 'take-out'.

Cafeterias: are usually associated with business or institutions (e.g., offices, hospitals). These are self-serve eating places where a tray is provided to carry food items to a cashier.

Others: includes refreshment stands, snack bars, vending machines, chip wagons and caterers. They are usually found at supermarkets, theatres, exhibitions, sports events, parks, etc.

Food purchased from stores: Food purchased from stores reported on the diary was coded to 210 basic commodity groups. Information on type of store from which any food item was purchased was also collected on the diary. The respondents used the definitions below to answer. These definitions do not correspond to classifications used in the surveys of retail trade.

Supermarket: offers a wide variety of most grocery items (food and non-food). Retail co-operatives are included in this group.

Food specialty store: offers a wide variety of a limited number of items. Included in this group are butcher shops, fresh produce stores, bakeries, fish markets, delicatessens, health food stores, markets or stands, and direct purchases from producers and frozen food suppliers.

Convenience store: offers a limited variety of a general line of groceries (food and non-food items).

Other: any other type of store that sells food items, such as department stores, club-type stores, drug stores, etc.

Food expenditures made on trips overnight or longer: These include meals and snacks purchased from restaurants and food purchased from stores. Weekly expenditure estimates are derived from the monthly data collected on the questionnaire. During the initial interview, the respondent recalls food expenditures made while away from home overnight or longer during the previous calendar month.

Food expenditures made in restaurants, on trips overnight or longer, can be broken down by type of restaurant and type of meal. Food expenditures made in stores, on trips overnight or longer, cannot be broken down into type of store or type of food.

Food expenditures made locally and on day trips: These are reported by households using the weekly diary. Food expenditures made in restaurants, locally and on day trips, can be broken down by type of restaurant and type of meal. Food expenditures made in stores, locally and on day trips, can also be broken down into type of store or type of food.

How to Use the Statistical Tables

How to combine columns of data within a table

By combining columns of data within a table using the following technique, you can obtain averages of combined groups for any expenditure item. Columns are combined by using the weighted number of weekly records to calculate an estimate of the average expenditure for a given item for a grouping of two or more columns.

For example, the average expenditure on ground beef for households in the two lowest income groups is calculated as follows. Multiply the weighted number of weekly records by the average for an item for each of the columns being combined. Sum the results. Then divide this total by the sum of the weighted number of weekly records.

In Table 2a, the weighted number of weekly records is 4,253,050 in the lowest income group. Table 2d shows that, in 2001, these households spent on average per household \$1.33 per week for ground beef. The weighted number of weekly records is 5,680,560 in the second income group and the households spent \$1.58 for ground beef. Here is the calculation:

$$(4,253,050 \times 1.33) + (5,680,560 \times 1.58) = 14,631,841.3$$

$$14,631,841.3 \div (4,253,050 + 5,680,560) = 1.47$$

So, households in the two lowest income groups spent an estimated average of \$1.47 per household per week in 2001 for ground beef.

How to use the percentage of households reporting

The average expenditures given in the tables are estimates based on the total sample, that is, on households that reported buying an item in a given week **and** those that did not. We can use the percentage of households reporting to calculate the average amount spent on an item by those households that made the purchase.

In order to calculate the average expenditure per week on an item for those weeks it was purchased, divide the average expenditure on that item by the corresponding percentage reporting and then multiply by 100.

For example, in Table 2d, households in the highest income group spent \$1.38 per week for apples and Table 2e shows that 35.3% of records had purchases of apples. Here is the calculation:

$$\$1.38 \div 35.3 \times 100 = 3.91$$

So, households in the highest income group spent, on average, \$3.91 each week they purchased apples in 2001.

How to combine expenditure items into your own groupings

The average weekly expenditure per household for several items in a column can be added together to make new subtotals. (But *do not add* the percentage reporting values for different items.)

For example, in Table 2b, households in the third income group spent \$1.10 per household per week for breakfasts and \$1.75 for lunches. (The percentage reporting was respectively 12.4% and 14.3%.) Here is the calculation:

$$1.10 + 1.75 = 2.85$$

So, households in the third income group spent \$2.85 per household per week for breakfasts and lunches in 2001. (Nevertheless, **we can't say** that the percentage reporting is 26.7% (12.4% + 14.3%).)

How to calculate total expenditure on an item for all households or a sub-group of households

To calculate how much was spent on an item for all households or households in a particular sub-group (e.g., all households in the lowest income group), multiply the average weekly expenditure per household for an item by the estimated number of households at the top of the column.

For example, in Table 2a, if there are 2,187,280 in the lowest income group and Table 2d shows us that they spent per week on average \$0.87 per household for breakfast cereal, here is the calculation:

$$2,187,280 \times 0.87 = 1,902,934$$

So, households in the lowest income group spent \$1,902,934 per week in 2001 for breakfast cereal.

How to calculate expenditure share

Expenditure share, or market share, is the percentage of the total expenditure for an item that can be attributed to a particular sub-group of households (e.g., the percentage of all meat expenditures made by households in the lowest income group). It is

calculated by dividing the total expenditure on an item for a given sub-group of households (to calculate, see above) by the total expenditure on the item for all households and then multiplying by 100.

For example, in Table 2a, there are 2,187,280 households in the lowest income group and they spent an average of \$10.03 per household per week for meat (from Table 2b). In total (Table 1b), there are 11,767,180 households and they spent an average of \$17.34 per household per week for meat (from Table 1b). Here is the calculation:

$$2,187,280 \times 10.03 = 21,878,238$$

$$11,767,180 \times 17.34 = 204,042,901$$

$$21,878,238 \div 204,042,901 \times 100 = 10.72$$

So, although households in the lowest income group represent 18.6% of all households, they made just 10.7% of all expenditure on meat in 2001.

How to calculate average expenditure per person

To calculate the average expenditure per person on an item, divide the average expenditure per household for that item by the average household size.

For example, in Table 2d, households in the highest income group spent \$9.96 per household per week for fresh vegetables. Their average household size is 3.45 persons (Table 2a). Here is the calculation:

$$9.96 \div 3.45 = 2.89$$

So, the members of households in the highest income group spent on average \$2.89 per person per week for fresh vegetables in 2001.

When comparing estimates of per person expenditure, the user should consider the differential effects of household composition (number of adults and children) on food expenditure, as well as savings derived from the sharing of food purchased in large quantities.

How to calculate expenditure on an item as a percentage of food purchased from stores

To calculate the proportion of food purchased from stores that a given item represents, divide the average expenditure per household for that item by the average expenditure on food purchased from stores and multiply by 100.

For example, in Table 1d, Canadian households spent an average of \$12.51 per household per week for bakery and other cereal products. The average expenditure on food purchased from stores was \$86.24. Here is the calculation:

$$12.51 \div 86.24 \times 100 = 14.51\%$$

So, the expenditure on bakery and other cereal products as a percentage of total expenditure from stores is 14.51% for 2001.

Custom Tabulations

The information in this publication represents only a summary of the results available from the 2001 Food Expenditure Survey. Custom tabulations can be produced to your specifications on a cost recovery basis (subject to confidentiality restrictions).

Public-use Microdata File

A public-use microdata file based on the 2001 survey will be available later in 2003. All records are thoroughly screened to ensure the anonymity of respondents. Public-use microdata files presenting spending data from previous food expenditure surveys are available for the following years: 1984, 1986, 1990, 1992 and 1996.

Client Services

For more information or to enquire about the concepts, methods, data quality or the product line, contact Client Services (1 888 297-7355 or 613 951-7355; income@statcan.ca), Income Statistics Division.
