Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- ^p preliminary figures
- ^r revised figures
- x confidential to meet secrecy requirements of the Statistics Act
- ^E use with caution
- F too unreliable to be published

Note: Due to rounding, totals may not add.

This publication was prepared under the direction of the Dairy/Food Unit:

Kimberley Boyuk, Unit Head

Anna Michalowska, Statistical Officer

Pat Chandler, Statistical Officer

Denise Barbe, Statistical Assistant

Food Consumption in Canada – 2003

Though many countries closed their borders to Canadian beef in May 2003, domestic demand increased.

This release uses new experimental data designed to estimate food consumed. The data are based on the traditional estimates of food available for consumption. However, the new food consumption data adjusts for retail, household, cooking and plate loss.

Beef consumption goes up

As much of the world eliminated Canadian beef from their diets, Canadians ate more. Beef consumption in Canada increased 5.0% to 14.2 kg per person in 2003.

On May 20, 2003, most nations imposed a ban on Canadian beef products after a single breeder cow in northern Alberta had tested positive for bovine spongiform encephalopathy (BSE), more commonly known as mad cow disease. As a result, both exports and domestic slaughter plunged. Even so, last year more beef disappeared within the domestic market.

As Canadians chose beef more often, they also ate less pork. Consumption of pork fell 9.6% to 10.9 kg. In total, Canadians ate 27.0 kg of red meat, down from 27.2 kg consumed in 2002 and the fourth consecutive drop.

Consumers benefited from more favourable beef prices in the last half of 2003. Retail prices for ground beef and lower cuts of beef began falling in June, reaching a low in September. However, retail prices for higher-valued beef cuts remained strong due to a number of factors including high demand by Canadian consumers for the barbeque season, high food service demand and low levels of imports. The price for pork or chicken products remained stable. Along with Canadians showing support towards beef farmers, lower prices for some beef aided in the shift from pork to beef.

Poultry meat consumption holds its course

Consumption of poultry has made major gains in the past ten years, increasing 21%. In 2003, the amount of poultry eaten by Canadians remained on par with 2002 at 13.6 kg. Chicken remains the poultry of choice as Canadians ate 10.8 kg in 2003. The ongoing popularity of easy to prepare and ready to eat chicken products with time conscious consumers along with the publicised health benefits of poultry has contributed to the increased intake of chicken.

Cereal consumption dips slightly

Despite the popularity of low-carb diets, Canadians are still demanding grain-based products such as pasta, bakery products and cereal-based snacks. Though total cereal consumption fell slightly to 63.9 kg per Canadian in 2003, it remained well above the 55.5 kg consumed by each Canadian ten years earlier. Products made

with wheat flour accounted for the majority. Though down 3.6% to 51.4 kg per person, wheat flour consumed remained nearly 8 kg per person over the 1993 level. Rice consumption continued to make inroads as Canadians ate 5.7 kg per person in 2003, up 2.2% over the previous year and nearly 1.3 kg over ten years earlier.

Fluid milk slumps as cream surfaces

Fluid milk slumped for the third consecutive year, as each Canadian drank 63.1 litres of milk in 2003, 5% less than ten years ago.

Though consumption of standard (3.25%) milk has decreased fairly steadily for nearly 40 years reaching 9.9 litres per person in 2003, 1% milk, which only really made its mark in the market place in 1990, has surpassed standard milk to reach 12.9 litres per Canadian.

However, Canadians have not abandoned higher-fat products entirely. Table cream continues to show a surge in popularity, as consumption in 2003 reached 1.8 litres per person, up more than 1 litre per person from a decade ago. The growth is in line with the increasing consumption of coffee especially from food service establishments in recent years.

Say cheese, demand is still strong

Cheese remains very popular with Canadians. Consumption of cheese has remained stable over the last years at near 8.8 kg per person. The strong demand for prepared food, convenient shredded cheeses including blended products used in Italian and Mexican dishes and promotional advertising campaigns are influencing consumption patterns.

The consumption of variety cheese has steadily increased to 4.8 kg in 2003, 19% more than a decade earlier.

Ice cream consumption dipped slightly to 6.4 litres per person, 20% below the 1993 level.

Yogurt continues to gain in popularity due in part to the development of tastier and innovative new products. Canadians consumed 4.3 litres in 2003, nearly double that of levels from a decade earlier.

Eggs are still a popular choice

Egg consumption stood at 13 dozen per person in 2003, up slightly from a year ago. The continued popularity of eggs can be attributed, in part, to public education campaigns outlining the nutritional benefits of eggs, increased use of eggs by the food service sector, the growing popularity of value-added products and the expanded use and availability of processed egg products.

Coffee and tea remain popular with consumers

Though Canadian coffee consumption dipped slightly in 2003, it has remain fairly stable, around 90 litres per person, over the past four years. The popularity of traditional and specialty coffees available from a growing number of coffee shops has fuelled coffee consumption.

Tea consumption continues to rebound as Canadians sipped nearly 81 litres, up over 2002 and well above the level of 54 litres a decade earlier. This growth, which has resulted in consumption surging to levels comparable to the early 1980's, can be attributed in part to the growing availability and popularity of specialty teas and to literature outlining the health benefits of tea.

Cheers, alcohol consumption dips slightly

For the second consecutive year, consumption of alcohol decreased slightly, as each Canadian adult drank 101.6 litres of spirits. Beer continues to be the drink of choice accounting for approximately 80% of all alcohol consumed.

The consumption of wine reached 12.8 litres per adult in 2003, up more than the equivalents of four bottles from ten years earlier. Spirit consumption remained fairly stable from a year earlier at 7.7 litres per person. These levels may be understated since they do not include the consumption of home made and brew-on-the-premises wine and beer or contraband alcohol.

CONCEPTS, METHODS AND SOURCES

Introduction

This publication represents a small portion of information available from *Canada Food Stats*, a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

Data presented in this bulletin are compiled from a wide variety of sources, both survey and administrative, and from various divisions within Statistics Canada along with other government departments. More information can be obtained from the Statistics Canada web site or by contacting the Agriculture Division directly. As this bulletin features food consumption statistics, a summary of the concepts and methods used for these data series has been provided.

CONCEPTS AND METHODS

Statistic Canada's Agriculture Division has produced data depicting the amount of food that is available for consumption or estimated quantities of food consumed in Canada as far back as 1960. Food available for consumption does not account for losses in stores, households, private institutions or restaurants. Estimated quantities of food consumed are based on availability adjusted for retail, household, cooking and plate loss.

The nutrient consumed tables estimate the amount of each type of nutrient actually consumed on a daily basis by Canadians. They have been derived by adjusting the nutrients available from the Canadian food supply to account for retail, household, cooking and plate loss. As the factors used to adjust the food available data are estimates themselves, considerable caution should be used when working with the data –the data should be viewed as experimental.

The nutritional data are derived by applying nutritional equivalent factors to the retail weight of apparent per capita disappearance data, often used as a proxy for food consumption. The Food Bureau of Agriculture and Agri-Food Canada developed these factors in cooperation with Statistics Canada. The factors were applied to each food or beverage type and then summed to derive subtotals or totals. They remain consistent over time starting in 1976. Consequently, the nutritional data are a subset of the Food Consumption in Canada data series. This data series is more correctly termed per capita disappearance.

Disappearance refers to the amount of food available for consumption and is derived residually using supply-disposition tables. All components of supply are added together and all uses (disposition) other than consumption are deducted. The resulting amount is assumed to be available for human consumption.

To calculate total supply, beginning stocks, production and imports are added together. Net supply is then derived by subtracting disposition items including exports,

manufacturing uses, feed, waste and ending stocks. The net supply is divided by the Canadian population at July 1 to obtain per capita values or disappearance per person.

The data for the numerous supply-disposition tables are obtained from a myriad of survey, administrative and other sources. Each food commodity table is unique.

In general, beginning stocks are those quantities of fresh and frozen food products held in storage at January 1 while ending stocks refer to year-end inventories (December 31). Stock and production data are obtained through surveys of producers and food processors. Import and export data are provided by the International Trade Division of Statistics Canada. Manufacturing data include requirements for processing, seed, animal feed and industrial use. Processed foods are then accounted for directly.

Traditionally, the waste factors attempt to account for quantities removed during processing or lost in storage. They do not allow for losses in stores, households, restaurants or institutions during storage and preparation or for unconsumed food. Consequently, the disappearance data are sometimes referred to as "apparent" to remind users of this data limitation. The nutrients consumed are not apparent but rather represent Statistics Canada's best estimate of actual consumption as the disappearance data were adjusted to account for food losses not previously accounted for.

The new waste adjustment factors account for losses at the retail and consumer levels, including institutions, restaurants and households. The factors attempt to account for losses or waste from storage, in the preparation of food and from the plate. The factors were provided with appreciation from the United States Department of Agriculture. Minor adjustments were made to the factors to take into account that there are some differences between the Canadian and American climate and culture. Further, the waste factors for oils were adjusted upwards in anticipation of expected adjustments to be made by the USDA.

All of the nutrient factors and waste adjustment factors are based on weight. Consequently, the waste adjustments have a limitation in that they may only partially account for losses of some nutrients as a result of cooking. For instance, more (or less) fat, fat soluble nutrients or water soluble nutrients may be wasted depending on the methods used in preparation and cooking. Although every attempt has been made to adjust the nutrient data to estimate actual consumption the data are estimates, a limitation that readers should keep in mind when working with the files. Further, these data refer to nutrients available from food and beverages and do not account for nutrients that may be provided by dietary supplements or from the water supply.
