Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the Agency has developed standards of service that its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1 800 263-1136. The service standards are also published on www.statcan.ca under About Statistics Canada > Providing services to Canadians.

NOTE: This publication represents a small portion of information available from [Canada Food Stats](#) (23F0001XCB), a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

Food consumption in Canada – 2004

Canadians continue to lay off their veggies, but they are reaching for more fresh fruit, according to the latest data on food consumption.

Per capita consumption of fresh vegetables fell for the third consecutive year in 2004, hitting its lowest level since 1992.

On average, Canadians consumed 74.8 kg of fresh vegetables last year, down from 75.7 kg in 2003. Even consumption of processed vegetables, including canned and frozen varieties, fell from 15.8 kg to 15.1 kg.

Canada's favourite vegetable, potatoes, many of them eaten as french fries or chips, accounted for half of the decline in vegetable consumption. Consumption of potatoes has been trending down for three years.

Yet, other Canadian staples such as onions, lettuce and carrots are also trending lower.

On the other hand, each Canadian on average ate 37.6 kg of fresh fruits, up from 37.1 kg. Apples, bananas and oranges remained the fruit of preference, accounting for nearly half of all fresh fruit eaten.

Tropical and foreign fruits are still making inroads into diets. Prior to 1988, quantities of guavas and mangos sought in Canada were too small to be counted. Last year, they accounted for over a half a kilogram in our diet.

Consumption of pineapples has doubled since 1999 to 800 grams per person.

Juice consumption slipped for the second consecutive year. On average, Canadians each drank 24.9 litres of juice in 2004, down from 25.0 litres. Orange juice was the preferred beverage, accounting for half of all juice consumed, followed by apple juice, a distant second.

Overall use of oils and fats continued to rise, reaching 23.6 kg from 23.0 kg the previous year. Much of these products are in the form of salad oils and shortening, used in salad dressings, deep-fried products and baked goods.

Concepts, methods and sources

Introduction

This publication represents a small portion of information available from *Canada Food Stats*, a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

Data presented in this bulletin are compiled from a wide variety of sources, both survey and administrative, and from various divisions within Statistics Canada along with other government departments. More information can be obtained from the Statistics Canada web site or by contacting the Agriculture Division directly. As this bulletin features food consumption statistics, a summary of the concepts and methods used for these data series has been provided.

Concepts and methods

Statistics Canada's Agriculture Division has produced data depicting the amount of food that is available for consumption or estimated quantities of food consumed in Canada as far back as 1960. Food available for consumption does not account for losses in stores, households, private institutions or restaurants. Estimated quantities of food consumed are based on availability adjusted for retail, household, cooking and plate loss.

The nutrient consumed tables estimate the amount of each type of nutrient actually consumed on a daily basis by Canadians. They have been derived by adjusting the nutrients available from the Canadian food supply to account for retail, household, cooking and plate loss. As the factors used to adjust the food available data are estimates themselves, considerable caution should be used when working with the data—the data should be viewed as experimental.

The nutritional data are derived by applying nutritional equivalent factors to the retail weight of apparent per capita disappearance data, often used as a proxy for food consumption. The Food Bureau of Agriculture and Agri-Food Canada developed these factors in cooperation with Statistics Canada. The factors were applied to each food or beverage type and then summed to derive subtotals or totals. They remain consistent over time starting in 1976. Consequently, the nutritional data are a subset of the Food Consumption in Canada data series. This data series is more correctly termed per capita disappearance.

Disappearance refers to the amount of food available for consumption and is derived residually using supply-disposition tables. All components of supply are added together and all uses (disposition) other than consumption are deducted. The resulting amount is assumed to be available for human consumption.

To calculate total supply, beginning stocks, production and imports are added together. Net supply is then derived by subtracting disposition items including exports,

manufacturing uses, feed, waste and ending stocks. The net supply is divided by the Canadian population at July 1 to obtain per capita values or disappearance per person.

The data for the numerous supply-disposition tables are obtained from a myriad of survey, administrative and other sources. Each food commodity table is unique.

In general, beginning stocks are those quantities of fresh and frozen food products held in storage at January 1 while ending stocks refer to year-end inventories (December 31). Stock and production data are obtained through surveys of producers and food processors. Import and export data are provided by the International Trade Division of Statistics Canada. Manufacturing data include requirements for processing, seed, animal feed and industrial use. Processed foods are then accounted for directly.

Traditionally, the waste factors attempt to account for quantities removed during processing or lost in storage. They do not allow for losses in stores, households, restaurants or institutions during storage and preparation or for unconsumed food. Consequently, the disappearance data are sometimes referred to as "apparent" to remind users of this data limitation. The nutrients consumed are not apparent but rather represent Statistics Canada's best estimate of actual consumption as the disappearance data were adjusted to account for food losses not previously accounted for.

The new waste adjustment factors account for losses at the retail and consumer levels, including institutions, restaurants and households. The factors attempt to account for losses or waste from storage, in the preparation of food and from the plate. The factors were provided with appreciation from the United States Department of Agriculture. Minor adjustments were made to the factors to take into account that there are some differences between the Canadian and American climate and culture. Further, the waste factors for oils were adjusted upwards in anticipation of expected adjustments to be made by the USDA.

All of the nutrient factors and waste adjustment factors are based on weight. Consequently, the waste adjustments have a limitation in that they may only partially account for losses of some nutrients as a result of cooking. For instance, more (or less) fat, fat soluble nutrients or water soluble nutrients may be wasted depending on the methods used in preparation and cooking. Although every attempt has been made to adjust the nutrient data to estimate actual consumption the data are estimates, a limitation that readers should keep in mind when working with the files. Further, these data refer to nutrients available from food and beverages and do not account for nutrients that may be provided by dietary supplements or from the water supply.
