## Information to access the product

This product, catalogue no. 21-020-XIE, is available for free in electronic format. To obtain a single issue, visit our website at [www.statcan.ca](http://www.statcan.ca) and select Publications.

## Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the Agency has developed standards of service that its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1-800-263-1136. The service standards are also published on [www.statcan.ca](http://www.statcan.ca) under About us > Providing services to Canadians.

## Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0<sup>s</sup> value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- <sup>p</sup> preliminary figures
- <sup>r</sup> revised figures
- x suppressed to meet the confidentiality requirements of the Statistics Act
- <sup>E</sup> use with caution
- F too unreliable to be published

This publication was prepared under the direction of:

Mark Elward, Chief  
Anna Michalowska, Statistical Officer  
Patricia Chandler, Statistical Officer  
Denise Barbe, Statistical Assistant  
Jean-Pierre Pelchat, Analyst

## Acknowledgement

Agriculture Division would like to acknowledge the contribution of the Food Bureau (Agriculture and Agri-Food Canada) and the Nutrition and Healthy Eating Unit (Health Canada) to this program.

**Note:** This publication represents a small portion of information available from [Canada Food Stats](#) (23F0001XCB), a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

## Food Consumption in Canada – 2005

*This release uses data designed to estimate fork level food consumption. The data are based on the traditional estimates of food available for consumption. However, the new food consumed data have been adjusted for retail, household, cooking and plate loss.*

### Fruits & vegetables –potato consumption is down

On the whole, Canadians are turning to more fresh fruits and vegetables in their diet, and away from oils and fats, according to the latest snapshot of food consumption for 2005.

On average, they consumed 39.4 kilograms of fresh fruit last year, compared with 37.6 kg the year before and 36.0 kg in 1995. On the other hand, consumption of processed fruits (canned, frozen or dry) fell modestly to 8.0 kg per person.

Apples accounted for about one-fifth of fresh fruit consumption. Each Canadian consumed on average 7.6 kg per person of apples last year, up from 6.8 kg in 2004. Bananas, oranges and grapes are also still the fruits of choice. But others such as mangoes, limes, papayas and pineapples are growing in popularity.

Canadians also consumed more fresh vegetables, but only if you don't count fresh potatoes, which have been falling out of favour.

On average, each Canadian consumed 68.9 kg of fresh vegetables in 2005, down from 69.4 kg in 2004. However, excluding potatoes, fresh vegetable consumption rose from 39.8 kg per person in 2004 to 40.5 kg last year. Many of the popular vegetables such as carrots and onions were more popular in 2005, although tomato consumption declined modestly.

Total potato consumption is included in the total fresh vegetables despite the fact that they may be consumed as french fries or potato chips. Recently, experimental data have been incorporated into the program that display the different ways that the spud is processed before being sold.

In total, consumption of potatoes has been declining in recent years, falling from 33.9 kg per person in 1995 to 28.5 kg last year. Generally, over time, exports (particularly those of frozen french fries) have soared, rising 141% during the past decade. Meanwhile, farm production of potatoes has also expanded but not as rapidly.

In 2005, farm production of potatoes tumbled 18.2%, considerably more than the 8.2% drop in exports. This limited the supply available for consumption, pushing prices higher.

Of the total potatoes consumed, 56% are cooked from fresh potatoes, while 44% were processed into products such as frozen french fries or potato chips. The decline in total potato consumption has occurred primarily because Canadians are cooking fewer fresh potatoes.

Last year, each Canadian on average consumed 15.8 kg of potatoes that had been purchased fresh, down from 16.8 kg the previous year. A decade ago, average fresh potato consumption was 21.8 kg per person. Consumption of potato chips amounted to 2.5 kg per person in 2005, while consumption of frozen french fries hit 6.4 kg, both holding stable.

The consumption of juice has dipped slightly from 2004, remaining just below 25 litres per Canadian. It is no surprise that orange juice remains the juice of choice at 12.1 litres each and is double apple juice, the second preferred juice. Vegetable juices comprise a small portion of juice consumption.

Fruits and vegetables contribute fiber, vitamins -- such as A and C, and minerals to diets. Along with grain products, *Canada's Food Guide to Healthy Eating* recommends that vegetables and fruits should constitute the major components of a healthy eating pattern.

### **Oils and fats decline modestly**

Canadians have reduced their consumption of butter and margarine, along with salad or cooking oils to 21.4 kilograms per person. The 2005 total oil and fat consumed fell a modest 1.7% from 2004 and it is 4.6% lower than the 1998 peak. The total use of oils and fats has been on the increase over time particularly during the nineties. The overall use was boosted by the increased usage of salad oils and shortening oils by households and/or food service outlets in salad dressing, deep-fried products and baked goods such as cookies, pastries, specialty breads and croissants.

*Canada's Food Guide to Healthy Eating* recommends choosing lower-fat foods more often. Though oils and fats do provide some essential lipids and vitamin E to diets, they are also high in calories.

### **Fish consumption wavers**

The consumption of fish rose 3.0% to 6.8 kilograms per person in 2005. Even though this figure is up from last year and a decade ago, it is below 2003. Fish consumption appears to be fairly stable this decade despite the fact that it fluctuates a little from year to year.

Besides being a good source of protein, seafood, including fish, is low in saturated fat. Fish also offers potential health benefits from omega-3 fatty acids along with several vitamins and minerals. Even with all these good attributes, when given the choice between red meat, poultry or fish, Canadians consume fish the least.

### **Calories consumed eases**

The level of energy consumed per person declined by 1.1% in 2005. Caloric consumption has been stable this decade after expanding fairly rapidly during the nineties.

Prior to 1980 energy disappearance for the United States, United Kingdom and Canada were at a similar level. Around 1980, the American caloric disappearance began to rise, yet Canadian caloric disappearance mirrored that of the United Kingdom remaining stable. However, since 1993 Canadian caloric disappearance has begun to rise and by 2001 it had nearly reached the level of that found in the United States. The energy disappearance of the United Kingdom has only increased moderately during this time.

Many reasons can account for the increase of energy disappearance in Canada from 1993 on. In the early 1990s Canada was just coming out of a recession, people had discretionary money to spend again. With the ease of drive-thru restaurants and the demands of everyday life – long days in the office, transporting children to hockey practice, music lessons, etc. – people increased their frequency of buying meals from restaurants, especially fast food establishments. Another possible reason may be the influence of American culture on Canadian society and the integration of the North American food industry. With the ease of franchising, more and more fast food restaurants of all kinds, including coffeehouses, have become established in Canada.

---

## Concepts, methods and sources

### Introduction

This publication represents a small portion of information available from *Canada Food Stats*, a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

Data presented in this bulletin are compiled from a wide variety of sources, both survey and administrative, and from various divisions within Statistics Canada along with other government departments. More information can be obtained from the Statistics Canada web site or by contacting the Agriculture Division directly. As this bulletin features food consumption statistics, a summary of the concepts and methods used for these data series has been provided.

### Concepts and methods

Statistics Canada's Agriculture Division has produced data depicting the amount of food that is available for consumption or estimated quantities of food consumed in Canada as far back as 1960. Food available for consumption does not account for losses in stores, households, private institutions or restaurants. Estimated quantities of food consumed are based on availability adjusted for retail, household, cooking and plate loss.

The nutrient consumed tables estimate the amount of each type of nutrient actually consumed on a daily basis by Canadians. They have been derived by adjusting the nutrients available from the Canadian food supply to account for retail, household, cooking and plate loss. As the factors used to adjust the food available data are estimates themselves, considerable caution should be used when working with the data—the data should be viewed as experimental.

The nutritional data are derived by applying nutritional equivalent factors to the retail weight of per capita food available data, often used as a proxy for food consumption. The Food Bureau of Agriculture and Agri-Food Canada developed these factors in cooperation with Statistics Canada. The factors were applied to each food or beverage type and then summed to derive subtotals or totals. They remain consistent over time starting in 1976. Consequently, the nutritional data are a subset of the Food Consumption in Canada data series. This data series is more correctly termed per capita food available.

The food available refers to the amount of food available for consumption and is derived residually using supply-disposition tables. All components of supply are added together and all uses (disposition) other than consumption are deducted. The resulting amount is assumed to be available for human consumption.

To calculate total supply, beginning stocks, production and imports are added together. Net supply is then derived by subtracting disposition items including exports,

manufacturing uses, feed, waste and ending stocks. The net supply is divided by the Canadian population at July 1 to obtain per capita values or disappearance per person.

The data for the numerous supply-disposition tables are obtained from a myriad of survey, administrative and other sources. Each food commodity table is unique.

In general, beginning stocks are those quantities of fresh and frozen food products held in storage at January 1 while ending stocks refer to year-end inventories (December 31). Stock and production data are obtained through surveys of producers and food processors. Import and export data are provided by the International Trade Division of Statistics Canada. Manufacturing data include requirements for processing, seed, animal feed and industrial use. Processed foods are then accounted for directly.

Traditionally, the waste factors attempt to account for quantities removed during processing or lost in storage. They do not allow for losses in stores, households, restaurants or institutions during storage and preparation or for unconsumed food. Consequently, the food available data are sometimes referred to as “apparent” to remind users of this data limitation. The nutrients consumed are not apparent but rather represent Statistics Canada’s best estimate of actual consumption as the disappearance data were adjusted to account for food losses not previously accounted for.

The new waste adjustment factors account for losses at the retail and consumer levels, including institutions, restaurants and households. The factors attempt to account for losses or waste from storage, in the preparation of food and from the plate. The factors were provided with appreciation from the United States Department of Agriculture. Minor adjustments were made to the factors to take into account that there are some differences between the Canadian and American climate and culture. Further, the waste factors for oils were adjusted upwards in anticipation of expected adjustments to be made by the USDA.

All of the nutrient factors and waste adjustment factors are based on weight. Consequently, the waste adjustments have a limitation in that they may only partially account for losses of some nutrients as a result of cooking. For instance, more (or less) fat, fat soluble nutrients or water soluble nutrients may be wasted depending on the methods used in preparation and cooking. Although every attempt has been made to adjust the nutrient data to estimate actual consumption the data are estimates, a limitation that readers should keep in mind when working with the files. Further, these data refer to nutrients available from food and beverages and do not account for nutrients that may be provided by dietary supplements or from the water supply.

1. In retail weight.

2. In fresh equivalent weight.

3. In milk solid equivalent; butter included under Oils and Fats.

4. In edible weight equivalent.

5. Does not adjust for losses, such as waste and/or spoilage, in stores, households, private institutions or restaurants or losses during preparation.

**Footnotes for table 8. Comparison table between Canada and United States**

1. In retail weight.
2. Includes apples, apricots, avocados, bananas, blueberries, cherries, cranberries, grapes, kiwi, mangoes, peaches and nectarines, pears, pineapples, papayas, plums and prunes, strawberries, melons, oranges, lemons, limes, and grapefruit.
3. Includes raspberries, strawberries, blueberries, apples and cherries.
4. Includes apples and applesauce, apricots, peaches, pears and pineapples.
5. Includes artichokes, asparagus, beans, broccoli, Brussels sprouts, cabbage, carrots, cauliflower, celery, corn, cucumbers, eggplant, garlic, lettuce, mushrooms, onions, peppers, potatoes, radishes, spinach, sweet potatoes and tomatoes.
6. Includes asparagus, beans, broccoli, carrots, cauliflower, peas and corn.
7. Includes asparagus, beans, cabbage, carrots, corn, cucumbers, peas, mushrooms and tomatoes.
8. Includes 1% and skim milk (Canada); includes 1% and 0.5% milk (U.S.).
9. Includes lower-fat buttermilk and flavoured milk.
10. Includes cereal, table, sour and whipping cream.
11. In eviscerated weight.
12. In edible weight.
13. Includes tree nuts, peanuts and coconuts.
14. Includes dry peas and dry beans.
15. In fresh equivalent.
