

Acute and Chronic Hepatitis C in Canada, 2000

Enhanced Hepatitis Strain Surveillance System (EHSSS)

Enhanced surveillance of acute hepatitis B virus (HBV) and hepatitis C virus (HCV) was initiated in 1998 to obtain a more accurate assessment of current infection levels as well as support the development of evidence-based prevention and control programs for hepatitis B and C. As of June 2002, the enhanced surveillance has been successfully integrated with the Viral Hepatitis Strain Surveillance System of the Canadian Science Centre for Human and Animal Health, National Microbiology Lab. This integration of epidemiologic and laboratory sciences allows for

the comprehensive surveillance of newly acquired cases of viral hepatitis B and C in Canada. The EHSSS was developed to enhance local public health surveillance needs for hepatitis B and C and to complement reportable data captured through the National Reporting System. Data were initially derived from four sites, and are currently derived from eight sites representing approximately 27% of the total population of Canada. These sites contribute data on acute and chronic hepatitis B and C infections, risk factors associated with infection and viral hepatitis genotype information.

Enhanced surveillance for newly identified hepatitis C virus infections in five health regions, 2000

Characteristic	Acute		Chronic	
	Number	Percentage	Number	Percentage
Age Group (year)				
< 5	3	2.5	45	1.4
5-9	0	0.0	4	0.1
10-19	6	5.0	47	1.5
20-29	36	29.7	371	11.8
30-39	46	38.0	984	31.2
40-59	29	24.0	1,503	47.7
60+	1	0.8	199	6.3
Sex				
Male	64	52.9	2,033	64.5
Female	57	47.1	1,120	35.5

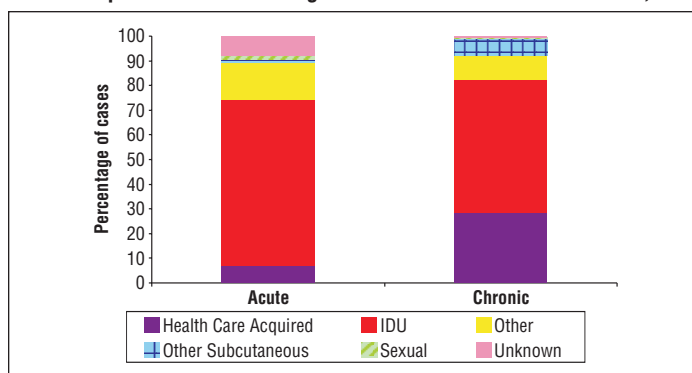

Incidence of acute hepatitis C according to age and sex in five health regions, 2000

Identification of chronic or like chronic hepatitis C according to age and sex in five health regions, 2000

Distribution of mutually exclusive risk factor groups for acute and chronic hepatitis C cases among those who have been interviewed, 2000

Health Care Acquired includes Blood Transfusion, receipt of blood product, hemodialysis, hospitalization, history of surgery, organ transplant, history of dental visit; **Other Subcutaneous** includes tattooing, body piercing, acupuncture; **Sexual** includes sex with hepatitis C carrier; **Other** includes drug snorting, blood contact, hepatitis C carrier in family, institution associated, incarceration.

Acute HCV Case Definition

1. Discrete onset of clinical symptoms; and
2. Serum aminotransferase levels 2.5 times the upper limit of normal; and
3. IgM anti-HAV negative (if done); and
4. IgM anti-HBc negative (if done) or HBsAg negative; and
5. anti-HCV positive (confirmed by a supplemental test); or
6. Seroconversion within 12 months.
