INTRODUCTION

The *Annual Horticultural Statistics for British Columbia* provides statistical data for the province and its key producing regions on the area, production, average price and value of all horticultural commodities in British Columbia. Coverage includes:

Floriculture
Greenhouse Vegetables
Field Vegetables
Tree Fruit

Nursery and Sod
Mushrooms
Specialty Crops
Berries, Grapes and Nut
Grapes for Processing

The information is provided for the 2003 crop year and is based on data supplied primarily by industry sources and through consultation with Provincial commodity specialists.

DEFINITIONS & EXPLANATIONS

AREA

Areas shown in the tables are estimates of harvested acreage. In the case of multiple planted crops (e.g., lettuce), the total acreage for all harvests over the year is reported. In the case of crops planted only once, but harvested one or more times (e.g., tomatoes and cucumbers), the planted acreage that is available for harvest is reported. For greenhouse crops, the area shown is the total area under glass or plastic. For tree fruits, berries and mushrooms, the area data are shown only in the summary table. Detailed area data for these commodities are available in the Statistics Canada publication, "Fruit & Vegetable Production: June 2004" (Cat. 22-003), which reports the results of their Spring 2003 area survey of fruits and vegetables.

FRESH SALES TO WHOLESALE

Fresh sales by growers to wholesalers are those made to marketing commercial agencies (i.e., cooperatives). Values are those reported by the various agencies or industry associations. Prices shown are farm-gate prices for graded and packed product sold by marketing agencies or the grower.

FRESH SALES FROM FARM AND ROADSIDE

Fresh farm and roadside sales by growers include roadside stand sales, direct farm sales to retail outlets and final consumers.

PROCESSED SALES

Estimates of sales to processors are obtained directly from processors. Negative prices and sale values for processed tree fruit indicate that the producer's gross return was negative because the market returns for the fruit failed to cover handling and processing charges.

VALUES

The values shown for "Wholesale" and "Processed" sales are net of agency charges.* The cost of hauling the commodity to the processor or marketing agency is generally borne by the producer. (Note: Prices are rounded and do not exactly result in the sale values shown when combined with quantities).

DATA CONFIDENTIALITY

Where there were less than three firms reporting information, the data have been combined for confidentiality reasons. In this report, data on processed field vegetable crops having less than three processors reporting are included in the processed sales of "Other Vegetables". Similarly, in the case of some berries where production is minor due to a few producers, "Fresh Wholesale" sales are included in the category "Roadside Sales".

REPORTING REGIONS

◆ *British Columbia*

Includes all of the regions noted below.

◆ *Vancouver Island*

Includes Vancouver Island, the Gulf Islands and the Sunshine Coast.

◆ *Lower Mainland*

Includes all of the Fraser Valley west of Hope.

◆ *Southern Interior*

Includes the Thompson-Okanagan and Kootenay regions. It is bounded by the Thompson River watershed, the Nicola watershed and the Fraser River watershed from Hope to Lillooet. The area extends southward to include roughly the area from Salmon Arm district south to the Princeton area and east to the British Columbia-Alberta border.

* A number of field vegetables that sold through marketing agencies have their agency charges included in the "Fresh Wholesale" and "Processed" prices (i.e. they are not "net of agency charges"). These fresh wholesale vegetables are: beets, topped; cabbage, green; cabbage, red; carrots, topped; onions, spring seeded; parsnips; rutabagas; potatoes (both types); cauliflower (Vancouver Island and the Interior only); celery; and head lettuce. The processed vegetables are: beans (both types); corn; peas; cauliflower; broccoli; and brussels sprouts.

◆ **Central – Peace**

Includes all the areas north and west of the Thompson-Okanagan (as defined on previous page) and the Lower Mainland bounded by the borders of Alaska, Yukon and the Northwest Territories. In general, the areas known as the Cariboo, Chilcotin, Central Interior, Upper Fraser, Nechako, Skeena, North Coastal, Peace and Liard, are included. While horticulture is concentrated in the Lower Mainland, Vancouver Island and the Southern Interior, the small and scattered production that occurs in the Central –Peace is frequently folded into the production shown for the Southern Interior.

SUMMARY OF 2003 WEATHER & CROP PRODUCTION

WEATHER

A cold wet spring caused some delays in early plantings of a variety of vegetable crops. A late frost occurring in May, just after planting, damaged some early vegetable crops (early potatoes) and delayed the planting and early development of principal crops. The main growing and harvesting seasons were excellent, however, and yields were above average.

Spring frost caused damage to and late maturation of some blueberry and strawberry crops however, harvest conditions were excellent resulting in generally higher yields and higher quality fruit.

In the Okanagan, some heat stress for certain crops did occur and the forest fires during the summer months resulted in some damage to grapes making them unmarketable. However, overall production levels were good as was the quality. Better weather, a good spring pollination and fruit set resulted in an excellent cherry crop in 2003. The quality of the apples in 2003 was good as well, in spite of the high temperatures for much of the summer.

Overall good weather resulted in large harvests for most vegetable, berry and treefruit crops in the Southern Interior and Mainland regions.

CROP PRODUCTION

◆ Floriculture

Floriculture sales in 2003 continued on their upward trend reaching a high of \$240 million. Increases in sales were mostly noted in cut flowers due to high demand for floral arrangements and bouquets, and sales to florists increased in 2003 by 29 percent. Export sales of cut flowers dipped somewhat due to the appreciating Canadian dollar. Sales to the mass market chain stores seem to be levelling off as there was less than a percent increase in sales due in part to oversupply of some container stock.

◆ Nursery and Sod

Nursery stock sales continued to climb in 2003 and reached \$160.4 million, an increase of 4 percent over 2002 sales of \$154 million. This increase is due in part to the continuing increase in nursery acreages and a substantial increase in BC housing construction and landscaping demand. Sales to landscape contractors surged 64 percent while sales to mass merchandisers and garden centres were also up considerably.

Sod acreages increased modestly from 2003. Both sales and harvested acreage increased by about 2 percent.

◆ Greenhouse Vegetables

The area of production of all greenhouse vegetable commodities increased from 497 acres in 2002 to 559 acres in 2003, an increase of 12 percent. Total production increased by 16 percent driven by the area expansion and a large increase in tomato production.

Greenhouse tomato acreage expanded again in 2003 and area increased by 7 percent. Although some of the tomato crop suffered from post harvest quality problems (i.e. soft fruit), production volume was up by 26 percent. A slightly lower price of 86 cents per pound resulted in the value of sales falling from a high of \$141 million in 2002 to \$136.5 million in 2003.

Sweet and hot peppers showed a slight increase in area grown in 2003. Although price was stable the total value of sales decreased by 3 percent. Unmarketable fruit and reduced yields due to an increased aphid population, lowered production. Two years of mild winters have caused aphid populations in greenhouses to remain at high levels throughout the winter season.

The greenhouse area of cucumbers declined from 74 acres in 2002 to 66 acres in 2003. However, production showed an increase of 6 percent because of higher yields. With a price increase per pound from 74 cents in 2002 to 79 cents in 2003, sales totalled \$26 million, an increase of 13 percent.

Greenhouse lettuce production continues to decline. Although the 2003 acreage remained unchanged from 2002, production declined by more than 50 percent or half a million pounds. In spite of a higher price per pound of \$1.38 farm value totalled only being \$565 thousand in 2003, a decrease of about 65 percent.

◆ Mushrooms

BC mushroom growers had a superlative year producing 56 million pounds of fresh and processed mushrooms in 2003, valued at a record \$78.8 million. This represented an increase of 16 percent from the year before and the highest reported sales level historically. As in 2002, the increase in value stems from a high price for fresh mushrooms of \$1.42 per pound. Fresh mushroom production increased by 15 percent from 48 million pounds to 55 million pounds and its share of total production increased to 98 percent. Processing volume and its share declined in 2003 as it had in 2002.

◆ Field Vegetables

Overall, field vegetable production in 2003 was very similar to 2002 with regards to acreage, volume and value. Total production was down about 2 percent while total sales dipped 3 percent.

The weather in 2003 was very “California-like”, with very little precipitation in June, July, August and September. Producers with ample irrigation saw their crops flourish, whereas those with inadequate irrigation saw reduced yields and quality. Heavy rains in mid-October brought the 2003 vegetable season to an abrupt halt, negatively affecting the late season cole crops and pumpkins. The single biggest factor affecting the total farm value of vegetable crops was the decrease in the price of potatoes, the largest vegetable, in 2003 compared to 2002. The average price for mid and lates declined from 27 cents per pound to 22 cents per pound lowering sales, in spite of higher acreages, by 16 percent in spite of higher acreages.

For the 2003 reporting year, a portion of potatoes falling under “Processed Potatoes” in the Field Vegetable Production table have been re-categorized. Some quantities previously reported as “Processing” have in fact been sales of fresh potatoes to food service outlets that use them for fresh-made French fries (e.g. the White Spot Restaurant chain). These have now been included in the “Fresh Wholesale” category. Consequently, the “Processed Sales” category of potatoes comprises only culls from potatoes in the “Fresh Wholesale” category sold for dehydration by processors.

◆ Specialty Crops

The harvested area of ginseng roots declined from 500 acres in 2002 to 400 acres in 2003, a reduction of 20 percent. Production decreased to 1.3 million pounds, however a strong grower price per pound of \$18.00 resulted in a total grower value of more than \$23 million, a 4 percent increase over 2002.

Ginseng seed production declined sharply, by 73 percent, due to the reduction of area and yield. A significant price reduction of 67 percent resulted in a very low total value of \$220 thousand, a decrease of more than 92 percent.

Seed potato acreage in 2003 increased by 7 percent. However, despite the increase in acreage production was down by 13 percent. A low average price of 14 cents per pound resulted in a total value of \$5 million, a reduction of more than 36 percent from 2002.

◆ Tree Fruit

Total grower value of the 2003 apple crop was \$61.1 million, down 15 percent from a high of \$72.2 million in 2002. Production volume in 2003 continued its downward trend of the past few years. The 2003 production volume was 272 million pounds, a decrease of 9.1 percent from 2002 when production volume reached almost 300 million pounds. The Gala variety has now surpassed Red Delicious as the leading volume variety in BC. Gala is also the leading apple variety in terms of total sales in the province. The newest variety, Ambrosia, continues to return the highest grower

price of 58 cents per pound compared to all other varieties. In 2003, apples accounted for 69 percent of the total farm value of BC tree fruit production.

The grower value of pears in 2003 decreased significantly from \$4.4 million in 2002 to \$3.4 million. Pear production continued to decline for the fourth consecutive year from 17.7 million pounds in 2002 to 15.5 million pounds in 2003. Lower prices for pear growers are attributed to a larger crop and marketings of fresh pears in the Pacific Northwest.

In contrast to pears, other types of soft fruits enjoyed an excellent year due to generally favourable growing conditions.

The sweet cherry crop volume of 2003 was substantially larger than in the past couple of years due to better spring pollination and fruit set. Sweet cherry sales maintained their top rank among soft fruits increasing significantly from \$11.8 million to \$15.4 million, an increase of almost 30 percent due to the increased production. In 2003 (as in 2002) the grower processed price for sweet cherries ended up being zero. This was because the price paid by the processors was equal to the cost that the fresh packing houses charged the growers for handling the volume diverted to the processors as a result of the fruit not meeting fresh market quality standards.

Peach growers harvested the largest crop since 1998. Volumes rose from 9.2 million pounds in 2002 to 11.3 million pounds in 2003, an increase of almost 23 percent. The grower value of the crop in 2003 was \$4.5 million, up from \$4 million in 2002.

Total apricot production in 2003 was up 58 percent from 2002. Fresh wholesale prices were down slightly, but farm and roadside prices were up significantly to a record \$1.25 per pound which lifted the value of farm sales to \$1.3 million, an increase of more than 92 percent.

Prune/plums showed good volumes and prices resulting in an increase in the value of their sales by 26 percent.

Nectarine production in 2003 was 1.2 million pounds, up from 748 thousand pounds in 2002, an increase of 62 percent. Despite a lower price per pound in 2003, total farm sales increased from \$420 thousand to \$578 thousand, an increase of 38 percent.

◆ **Berries, Grapes and Nuts**

The total farm value of the 2003 berries, grapes and nuts crop is estimated at \$159 million, an increase of 29 percent over the 2002 crop. The total volume of berries, grapes and nuts harvested in 2003 was 207 million pounds, an increase of 12.7 percent over 2002. The increase was driven by substantially increased production of blueberries and cranberries. Total sales value in 2003 was 61.2 percent higher than the previous five-year average (1998-2002), indicating that the industry is continuing to flourish.

The value of processing sales in 2003 was \$96.6 million, 20.4 percent above 2002 while processing volume increased by only 4.7 percent. Fresh sales totalled a record

\$62.3 million, an increase of 45.9 percent compared to 2002. Fresh sales volume in 2003 was 52.3 percent higher than in 2002.

The total 2003 production of strawberries was up 13.2 percent from 2002, which is a significant improvement from the performance of the past couple of years. Despite the higher production of 2003, a lower grower price per pound reduced the value of sales from \$7.6 million to \$7.5 million, a decrease of 1.2 percent.

The farm value of the 2003 raspberry crop increased modestly to \$22.9 million, or by 3.2 percent over 2002. This occurred due to a higher average processing price that offset a decrease in production of 5.5 percent from 29.8 million pounds in 2002 to 28.1 million pounds in 2003.

The value of the 2003 blueberry crop continued to expand as in the past several years with record sales of \$63.2 million being achieved, up by 42.8 percent from 2002. Fresh sales, the larger share of the total, were up a substantial 61.8 percent from 2002. Grower prices for fresh sales remained very high in 2003 and processed prices increased significantly from 95 cents per pound in 2002 to \$1.10 in 2003. Over 75 percent of the crop went to the fresh market which apparently left the BC processors in very short supply. Although demand for processed blueberries remains strong processing supply declined in 2003 due to the very high utilization by the fresh sector. New plantings are continuing to occur in response to the strong market.

Cranberry producers had a banner year in 2003. The harvest reached a record 85 million pounds and grower sales value totalled \$38.5 million, an increase of 63.4 percent over the 2002 crop. Although larger production contributed to the jump in value the main contributory factor was a processing price increase from 30 cents per pound in 2002 to 45 cents per pound in 2003. A farm value so high has not been achieved since 1995 when sales reached a high of \$40.7 million.

The grower value of the 2003 kiwifruit crop was \$242 thousand, or 20.4 percent above 2002 and largely the result of increased production. Higher yields per acre, due to excellent weather conditions, were the key factor in the increased production of 315 thousand pounds in 2003 compared to 201 thousand pounds in 2002.

The value of the 2003 hazelnut crop totalled \$533 thousand, a reduction of 21.5 percent since 2002. Total production for 2003 was 686 thousand pounds, or 8.8 percent below the 2002 crop.

The grape harvest continued its upward trend in 2003 driven by vinifera vine replantings because of increased wine consumption. It produced a record high grape volume of 35.3 million pounds. The season average price for wine grapes (which account for 96 percent of the crop) was 69 cents per pound, down from the 2002 price of 74 cents per pound. However, the larger wine grape crop resulted in a high overall farm value of \$24.9 million for the 2003 grape harvest.

STATISTICAL TABLES

GREENHOUSE VEGETABLE PRODUCTION, BRITISH COLUMBIA - 2003

*Historical data separated out green and wax (yellow) beans. Beans are now combined as it is consistent with the way Statistics Canada reports this category.

**Historically Savoy Cabbage was separated out. It is now combined in the Green Cabbage category.

***Historically cucumbers were split into two categories: pickling and slicing. In keeping with the way Statistics Canada reports this category, it has been combined into a single entity.

****Historically there were four categories for onions: bunched, fall seeded, spring seeded and silverskins. In keeping with the way Statistics Canada reports this category, fall seeded, spring seeded and silverskins have been combined into one category.

Onions, dry bulb.

***** See footnote under Mainland sheet

*Includes agency channels and packinghouse direct sales. Sales are recorded at the point of production.

** Nominal price received by packing houses from sales to processors

***Net price to growers after deduction of packing house charges. Shown as negative where packing house charges exceed the nominal price.

**** Price for the sweet cherries is zero because the price paid by the processors is the same as the cost that the packing houses charged the growers for handling the volume of fresh cherries which were diverted to the processors as a result of not meeting fresh market quality standards.

+ Value of processor sales are reported based on the net price to growers.
