INTRODUCTION

The *Annual Horticultural Statistics for British Columbia* provides statistical data for the province and its key producing regions on production areas, quantities produced, average prices and total values of the major horticultural commodities grown in 2004. Included in this publication is information on the following:

Floriculture
Greenhouse Vegetables
Field Vegetables
Tree Fruit

Nursery and Sod
Mushrooms
Specialty Crops
Berries, Grapes and Nut
Grapes for Processing

The data is based on information supplied primarily by industry sources and Provincial commodity specialists.

DEFINITIONS & EXPLANATIONS

AREA

Areas shown in the tables are estimates of harvested acreage. In the case of multiple cropping of one area (e.g., lettuce), the total acreage for all harvests over the year is reported. Where crops are planted once, but harvested one or more times (e.g., tomatoes and cucumbers), the planted acreage that is available for harvest is reported. For greenhouse crops, the acreage reported is the total area under glass or plastic. For tree fruits, berries and mushrooms, the planted acreage is reported only in the summary table. Detailed acreage for these commodities is available in the Statistics Canada publication, "Fruit & Vegetable Production: June 2004" (Cat. 22-003), a report summarizing the results of their spring 2004 area survey of fruits and vegetable production.

FRESH SALES TO WHOLESALE

Fresh sales by growers to wholesalers are usually made through commercial agencies (i.e., cooperatives) who market these commodities. Values are those reported by the various agencies or industry associations. Prices shown are farm-gate prices for graded and packed product sold by marketing agencies or the grower.

FRESH SALES FROM FARM AND ROADSIDE

Fresh farm and roadside sales of commodities by growers include roadside stand sales and direct farm sales to retail outlets and consumers.

PROCESSED SALES

Estimates of commodity volumes sold to processors are obtained from processors. Negative prices and sale values for processed tree fruits indicate that the producer's gross return was negative as the market returns for the fruit failed to cover handling and processing charges.

VALUES

The values shown for "Wholesale" and "Processed" sales are net of agency charges.* The cost of hauling the commodity to the processor or marketing agency is generally borne by the producer. (Note: Prices are rounded and when multiplied by quantity, do not result in exact sale values).

DATA CONFIDENTIALITY

Where there were fewer than three agencies reporting, data has been combined to protect confidentiality. In this report, data on processed field vegetable crops having fewer than three processors reporting are included in the processed sales of "Other Vegetables". Similarly, where a few producers are harvesting small quantities of berries, "Fresh Wholesale" sales are included in the category "Roadside Sales".

REPORTING REGIONS

◆ *British Columbia*

Includes all of the regions noted below.

◆ *Vancouver Island*

Includes Vancouver Island, the Gulf Islands and the Sunshine Coast.

◆ *Lower Mainland*

Includes all of the Fraser Valley west of Hope.

◆ *Southern Interior (Okanagan Kootenay Similkameen)*

Includes the Thompson-Okanagan and Kootenay regions. It is bounded by the Thompson River watershed, the Nicola watershed and the Fraser River watershed from Hope to Lillooet. The area extends southward to include roughly the area from Salmon Arm district south to the Princeton area and east to the British Columbia-Alberta border.

* A number of field vegetables that sold through marketing agencies have their agency charges included in the "Fresh Wholesale" and "Processed" prices (i.e. they are not "net of agency charges"). These fresh wholesale vegetables are: beets, topped; cabbage, green; cabbage, red; carrots, topped; onions, spring seeded; parsnips; rutabagas; potatoes (both types); cauliflower (Vancouver Island and the Interior only); celery; and head lettuce. The processed vegetables are: beans (both types); corn; peas; cauliflower; broccoli; and brussels sprouts.

◆ **Central – Peace**

Includes all the areas north and west of the Thompson-Okanagan (as defined on previous page) and the Lower Mainland bounded by the borders of Alaska, Yukon and the Northwest Territories. In general, the areas known as the Cariboo, Chilcotin, Central Interior, Upper Fraser, Nechako, Skeena, North Coastal, Peace and Liard, are included. While horticulture is concentrated in the Lower Mainland, Vancouver Island and the Southern Interior, the small and scattered production that occurs in the Central –Peace is frequently folded into the production shown for the Southern Interior.

1 Harvested area information: Statistics Canada, Fruit and Vegetable Production (June 2004) Cat. No. 22-003-XIB.

2 Total harvested (bearing) acres for Tree fruit includes: apples, apricots, sweet and sour cherries, peaches, pears, plums and prunes; excludes crabapples and nectarines.

3 Total harvested (bearing) acres for Berries and nuts include: blueberries, cranberries, grapes, raspberries and strawberries; excludes kiwifruit and hazelnuts.

Data supplied by fresh market packers, processors and Ministry of Agriculture & Lands commodity specialists.

SUMMARY OF 2004 WEATHER & CROP PRODUCTION

WEATHER

Unusually warm weather early in 2004 followed by warmer, dryer weather throughout the growing season generally accelerated crop development. As a result, the harvest season was advanced for many crops to earlier than normal dates. Record rains in mid-to-late August eased the moisture stress for many crops, but a heavy rainfall in mid September caused considerable loss of late harvested field vegetables.

As the majority of the growing season was warm and dry, crop quality for those crops harvested early, was good to excellent with the quantities produced comparing favourably with 2003. However, the very wet cool harvest season adversely affected the ripening and harvest of some crops requiring a longer growing season. For these crops, harvesting was delayed due to the wet conditions of fields. In some cases, crops rotted or had to be left in the field.

CROP PRODUCTION

○ Field Vegetables

The abnormally warm weather throughout the growing season affected all crops. Early vegetables were harvested about two weeks ahead of the typical harvest schedule due to the early spring. For example, nugget potatoes were available on May 17th, when the usual harvest is the first week of June. Late blight on potatoes was noted a month early, just after the rains in May while it is usually not detected until late June.

Harvesting of some crops was delayed due to the unseasonably wet conditions impeding movement of equipment onto wet fields. Some potato fields were harvested by hand and significant portions of other fields were not harvested. Late blight infestation of stored potatoes was a concern with potatoes harvested during wet conditions when blight spores thrive. Other crops were also adversely affected. Prolonged wet soil conditions delayed the broccoli harvest and also caused a large number of culls due to rot. Some pumpkin growers reported that their crops matured early and started to rot in the fields.

Although the field vegetable harvest area increased about 2% or almost 420 acres from 2003, quantities produced and the value of the production declined for the majority of crops. Production fell 5% or more than 14 million pounds and the value realized was almost \$7 million less than the previous year.

○ Greenhouse Vegetables

Expansion of greenhouse production area was minor in 2004 with the development of three acres, a significant decline from the 62 acres developed in 2003. This increase did not translate into greater production volumes or crop returns.

Cucumber production increased about 13% to over 38 million pounds in 2004. A larger harvest was anticipated but yields were affected by powdery mildew. Average price per pound was \$0.03 less than in 2003, but the greater quantity harvested increased the total crop value by 10%.

Tomato crops were affected by a virus and so the anticipated harvest volumes did not materialize. As a result, the crop production of almost 135 million pounds was 18% smaller than in 2003. Prices were severely depressed for a few months falling to 1960's levels but did rebound in the fall. Average price per pound remained unchanged from the previous year at \$0.86 with total crop value just over \$116 million, a decrease in receipts of almost 18%. Information about beefsteak tomatoes and vine tomatoes was collected as both types were produced in significant quantities.

Sweet and hot pepper yields increased by almost 7% although growers had to contend with some fusarium interior rot problems along with pepper powdery mildew and aphids. Pepper powdery mildew; a new disease for BC peppers in 2003, was found in some greenhouses but was not considered to be as severe as in the previous year. The aphid problems were also not as extensive as in the previous growing season. Even with the increased harvest volume of 3 million pounds, the total crop value decreased from 2003 with the decrease in price. Average price per pound fell about \$0.20 to \$1.49 decreasing the total crop value to just over \$4 million, a decline of 6%.

○ **Mushrooms**

Mushroom production increased 7% to over 58 million pounds from the previous year. The hot weather resulted in a higher percentage of jumbos which raised growers' average price but also decreased total anticipated production. Compost quality fluctuations and higher ambient temperatures were also contributing factors to smaller harvests.

The value of the mushroom harvest decreased negligibly to \$77.4 million, down from the record \$78.8 million realized in 2003.

○ **Specialty Crops**

Quantities of **ginseng roots** harvested decreased approximately 30% from the previous year to one million pounds and the harvested acreage declined 75 acres or 19% to 325 acres. Average price per pound was one half of the 2003 price, from \$18 per pound in 2003 to \$9 in 2004.

Ginseng seed production and harvested area also decreased from 2003 but product prices remained stable. In 2004, average yield per acre was about 80 pounds; in 2003, average yield was 98 pounds per acre. Two hundred acres were harvested in 2004, a decrease of 25 acres or 11% from 2003. Seed value remained unchanged from 2003, averaging \$10 per pound.

Acres of **seed potato** harvest decreased by 391 acres, from 2,220 to 1,829 acres, a decline of almost 18% from 2003. Production decreased 15% or more than five million pounds to just over 30 million pounds. Prices were up to \$0.15 per pound, an increase of \$0.01 cent from 2003.

The harvested acreage of **organic potatoes** decreased 83 acres or almost 22% from the previous year but average pounds per acre almost doubled from 9,487 pounds in 2003 to 17,589 pounds in 2004. Average price per pound remained stable at \$0.32 per pound in 2004, up one cent from 2003.

- **Tree Fruits**

Total tree fruit production was only marginally lower than in 2003 although 660 fewer acres were harvested. Excellent weather conditions throughout the growing season ensured high volumes of good quality fruit.

Although the apple crop volume was within one percent of the total production of 2003, the market returns were less than half of the crop receipts received the previous year. Oversupply of Washington state apples forced prices below cost of production although crop quality was excellent but for some hail damage to a few orchards. The average price per pound was \$0.14 while in 2003 the average price per pound was \$0.28.

Pear production was down 18% to about 13 million pounds and average price per pound declined from 2003. Total crop value was \$2.7 million, a decrease of approximately 26%.

Volumes of peaches and nectarines produced during the 2004 growing season were similar to those of 2003. However, prices were not as high so total crop value declined about 13%.

The apricot crop was reasonably large but fruit size was decreased, probably caused by the hot early season. Competition from the US crop decreased the returns to the BC producers although better prices were realized with large fruit sizes.

The cherry crop harvest increased more than 8% in 2004 as spring pollination and subsequent fruit set were better than in previous years. Quality was reasonably good for early varieties, but later the crop suffered from heat stress and mildew damage; and hail damage in some areas. Marketing was difficult with claims of a soft product and prices were correspondingly lower with a drop in total crop value of \$1.4 million from 2003. Some growers in the Kelowna area abandoned crops on the trees.

Prune production remained unchanged from 2003 but the average price for farm and roadside sales were down significantly from \$1.10 to \$0.72 per pound so total sales decreased by 28% to \$1.07 million. In contrast, the plum crop volume and total value almost doubled from the previous year.

- **Berries, Grapes & Nuts**

Following an unusually early spring, the growing season continued to be warmer and drier than normal advancing the harvest of berry crops by up to 3 weeks. Record rains through late August and September damaged the tail end of the blueberry harvest, but eased the moisture stress in many other crops.

The strawberry harvest coincided with the only cool, wet weather of the summer, but, in spite of some rain, growers had good yields and a quality product. Unusually warm spring

weather advanced crop development so that first strawberry harvest occurred May 20, the earliest ever recorded. Cooler, wetter weather through harvest created some difficulties with fruit rot and disease, but most growers reported good yields. Total quantities harvested were down 16% or one million pounds from 2003, but increased prices saw the total value of the harvest increase by almost 4%.

Raspberry canes sustained significant winter damage and then extremely hot weather during crop development further reduced anticipated yields. Fortunately, world-wide crops were light so crop prices were at their highest level in years. Harvest quantities were down from 2003 by 15% or almost 4 million pounds but the crop value increased by 10% or almost \$2.4 million over the previous year.

The blueberry crop had nearly perfect weather conditions during fruit set and development. A record crop of almost 68 million pounds was harvested as a result of the excellent growing conditions and new acreage coming into production. This was an increase of 27% or 18 million pounds from 2003. Average prices per pound were less than the previous year but the large volumes were able to compensate so that returns were up 13% or almost \$10 million. (Over half the berries were sold on the fresh wholesale market at prices averaging \$1.10 per pound, a decrease of from the average price of \$1.30 per pound in 2003. The large volume of berries destined for processing sold for an average price of \$0.95 per pound, a decrease from \$1.10 per pound in 2003.)

The association between blueberries and good health continues; the latest research project links blueberry consumption to reduced cholesterol. Industry growth will continue into the future as at least 3,500 acres have been planted but are not in production and another 1,500 acres were planted in the fall of 2004.

Cranberry bushes sustained significant winter damage but this did not affect the quality or quantity of the 2004 crop as the warm spring weather was excellent for crop development. With hot dry conditions prevailing through the summer months, growers became concerned about a shortage of water at harvest. Record rainfalls in September recharged the reservoirs and the early harvest of white cranberries went ahead as planned followed by red cranberry harvest later in the fall. Total volume harvested increased by 1% or a million pounds with the majority of the crop going to processed sales at an average price of \$0.40 per pound. As this was \$0.05/pound less than in 2003, total crop value decreased about 10%.

Wine grape production was expected to increase in volume with the usually warm, dry spring and summer. Early season growth and fruit set appeared very good, but the expected early harvest did not materialize due to the cooler weather in late August and early September. Rains during this period resulted in more rotting than usual, with bunch rots such as botrytis and sour rots making harvesting more difficult.

Red wine grape production surpassed 2003 production by 175,000 pounds or 1% while the volume of white variety production was down by almost 4% or 627,000 pounds.

- **Floriculture**

The industry had another good year in 2004 as it continues to grow to meet the needs of local and export markets. Weather was very favourable for field grown cut flowers and total floriculture crop value increased by \$5 million or 2% over the previous year to \$245 million. The United Flower Growers Auction set a record for daily product volume on May 6th - just prior to Mother's Day. On this day 1,313 wagons (37,000 units of product) was auctioned in just over 3 hours.

The weather was also advantageous for the production of greenhouse ornamental crops although the unseasonably hot summer did disrupt some crop schedules.

Area in production continues to increase with 25 more acres harvested than in 2003. Harvest area is now at 365 acres.

- **Nursery**

Nursery crops thrived with the exceptionally good growing conditions, and retail and wholesalers experienced strong demand for stock. Production expanded 75 acres (2%) to 3,825 acres and the value of the crops increased modestly by \$7.6 million to \$245 million.

Oversupply could become a challenge in the future with some nursery crops, most notably hedging cedars. The strength of the Canadian dollar is also a concern as the increase in its value from 2003 was apparent in the total sales realized.

- **Turf**

Strong housing starts continued to increase the demand for turf, resulting in a modest increase of 6% in the total value of turf sold in 2004. Approximately 1,360 acres of turf were harvested and was valued at \$8.5 million.

TOTAL Okanagan – Similkameen - Kootenay:	234,789		43,935	16,760		10,878	66,120			-2,825	317,669	51,988

1 Includes agency channels and packinghouse direct sales. Sales are recorded at the point of production.

2 Nominal price received by packing houses from sales to processors

3 Net price to growers after deduction of packing house charges. Shown as negative where packing house charges exceed the nominal price.

4 Value of processor sales are reported based on the net price to growers.

5 Price for the sweet cherries is zero because the price paid by the processors is the same as the cost that the packing houses charged the growers for handling the volume of fresh cherries which were diverted to the processors as a result of not meeting fresh market quality standards.
