Saskatchewan Health Population Projections 2006 to 2021

Historical Context

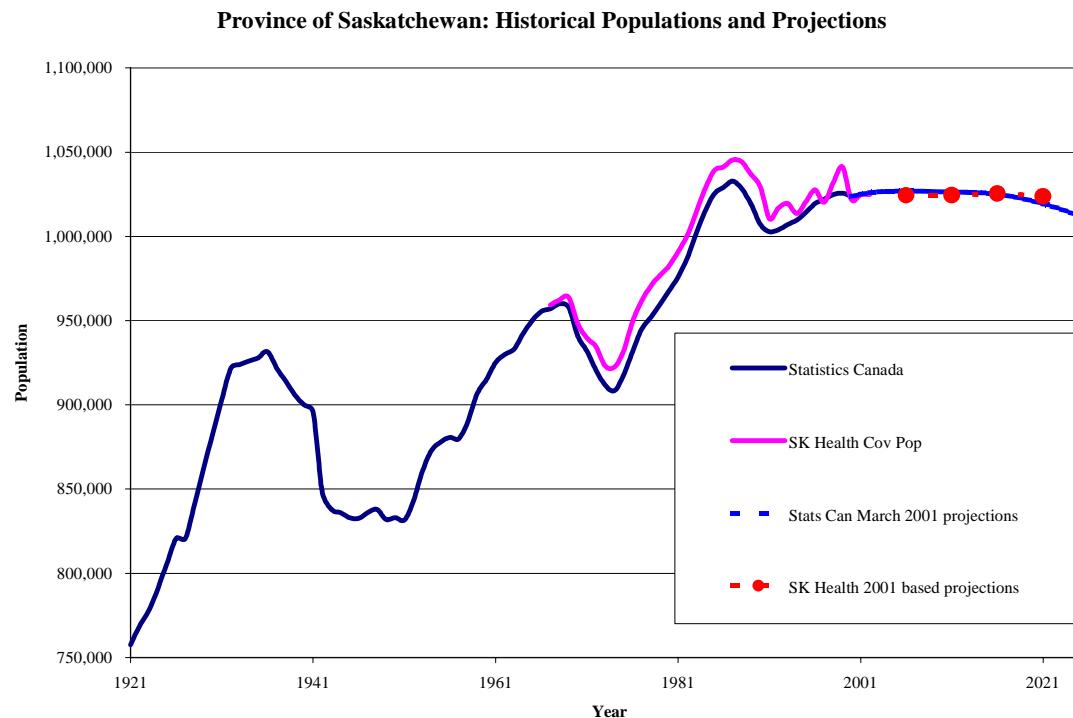

Figure 1: Statistics Canadaⁱ ⁱⁱ ⁱⁱⁱ and Saskatchewan Health^{iv} historical and projected populations for the province of Saskatchewan

From Figure 1, one can see that the population of the province of Saskatchewan is difficult to project as it is subject to fluctuations due to economic circumstances. The three year fluctuation in Saskatchewan Health's covered population starting around 1991 corresponds to Health Registration's three year renewal cycle which began when the unique lifetime identifier was introduced in December of 1990. The health card renewal years of 1993, 1996, and 1999 resulted in a drop in the covered population values for the following year (1994, 1997, 2000) due to individuals being removed from the registry when their renewal sticker was returned to Health Registration because of an invalid mailing address. Prior to 1991, Saskatchewan health insurance registration was renewed on a yearly basis.

Saskatchewan Health Population Projections 2006 to 2021

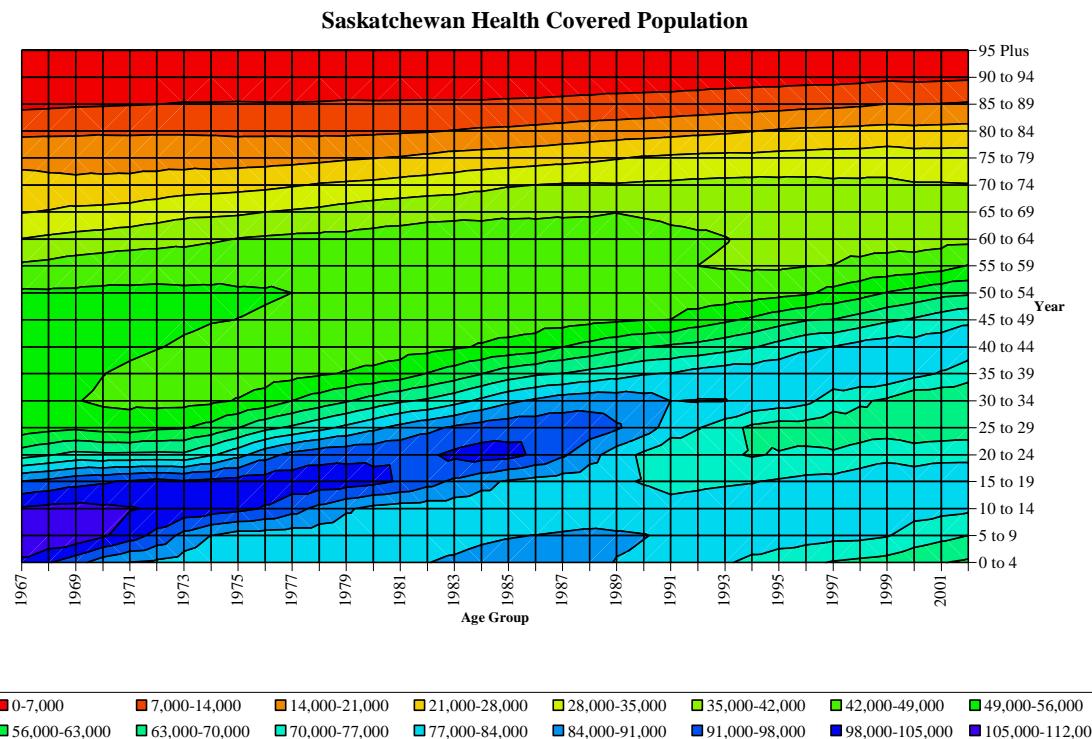

Figure 2: Saskatchewan Health covered population by age group for 1967 to 2002.

Figure 2 gives an overview of the covered population of Saskatchewan by age group for 1967 to 2002. Colours are used to indicate population values. The red end of the spectrum is used to show small populations and the blue end of the spectrum indicates large population values. The dark blue band that starts in the bottom left hand corner of the chart and runs diagonally across the page is the “baby boomers” (those people born between 1945 and 1966). The lighter blue band that starts in the bottom part of the graph around the early 1980s represents the children of the baby boomers sometimes called the “baby boom echo”.

Saskatchewan Health Population Projections 2006 to 2021

Documentation of Projection Method

Factors Influencing Population

These population projections are based on three main factors: year of birth, age group and district of residence. The number of births in a given year varies based on political, social, and economic conditions in addition to the number of potential parents. The most famous example is people born between 1945 and 1966 (the “baby boomers”). If one looks at a graph of the population of Saskatchewan by age group for 1996 in Figure 11, for example, the pronounced bulge between the ages of 30 and 51 is due to the fact that many people were born between 1945 and 1966 compared to other years. Population also varies by age group. For example, people in their twenties are more likely to move out of rural districts, older people have a greater probability of dying, and the number of 15 to 39 year olds influences the number of children that will be born. Each district has a different population profile. For example, in Northern Saskatchewan and the Northwest health district, children make up a large percentage of the population and Regina and Saskatoon health districts are more likely to attract and retain people in their 20s and 30s than rural districts.

Source Data

All historical population numbers are from Saskatchewan Health’s Covered Population data. The 1981, 1986, and 1990 numbers use the 1997 methodology to allocate Registered Indians to their place of residence and Plan10 district boundaries. The 1991 to 2000 actual numbers use the 1998-2001 methodology to allocate Registered Indian persons to their place of residence and Plan 11 district boundaries. The 2001 actual numbers use the 1998-2001 methodology to allocate Registered Indian persons to their place of residence and Plan 12 district boundaries. There are not major differences between the Plan 10, 11, and 12 district boundaries. The only difference between the 1997 and 1998-2001 methods of allocating Registered Indian persons is that the 1998-2001 method uses a more accurate way of assigning on reserve members of the Montreal Lake Cree Nation to Prince Albert or Mamawetan Churchill River health districts. The 1971 and 1976 actual numbers were derived from the covered population using Plan10 district boundaries with obsolete, non-identifiable residence codes assigned to Northern Saskatchewan. The 1971 and 1976 numbers do not have Registered Indian persons allocated to their place of residence because the necessary postal code information was not available for those years. In districts where this makes a significant difference to the populations, the 1971 and 1976 data was not used in the projections.

The population projections are based on data for 1971, 1976, 1981, 1986, 1991, 1996, and 2001. These intervals were chosen to correspond with Statistics Canada’s census years and because 1981 and 1986 were two of the rare years in the 1980’s where postal code information was still available to allocate Registered Indian persons to their place of residence rather than their band of origin.

Saskatchewan Health Population Projections 2006 to 2021

Population Projections for the Province of Saskatchewan

The population projections for the province of Saskatchewan were calculated as the sum of the population projections for each district. This method was chosen because it takes into account geographic differences in population dynamics rather than treating the whole province as a uniform entity and because it is internally consistent since the district projections add to the provincial projection. The disadvantage of this method is that any errors due to small numbers in the district projections are compounded in the provincial projection.

Calculation of Percentage Change for Known Years

Let $P_n(t)$ represent the population of age group n in year t . Consider $P_{n-1}(t)$. Five years later, this group of people will make up $P_n(t+5)$. The percentage change in the population of this cohort over five years is given by

$$\%C_n(t, t+5) = \frac{P_n(t+5) - P_{n-1}(t)}{P_{n-1}(t)} \times 100\%. \quad (**)$$

For example, there were 910.30 15-19 year olds in South Country Health District in 1991. Five years later, there were 639.35 20-24 year olds in the same district. The percentage change is given by

$$\%C_{20-24}(1991, 1996) = \frac{639.35 - 910.30}{910.30} \times 100\% = -29.76\%$$

The decrease in numbers is due mainly to more people born between 1972 and 1976 moving out of South Country than into the district between 1991 and 1996.

Projected Populations

We can turn around the percentage change calculation given above and use it to project populations at five-year intervals in the future. Solving equation (**) for $P_n(t+5)$ yields:

$$P_n(t+5) = P_{n-1}(t) \left[1 + \frac{\%C_n(t, t+5)}{100\%} \right].$$

Thus, if we know the population $P_{n-1}(t)$, we can predict $P_n(t+5)$. We don't know the percentage change $\%C_n(t, t+5)$, or else we could exactly predict future populations, but we can estimate it based on past values. In general, we take the average of the percent changes over the past six time periods and use that value to project future populations. The exceptions to this rule will be explained below, but for now let us return to the

Saskatchewan Health Population Projections 2006 to 2021

example of projecting the number of 20-24 year olds in South Country Health District in 2006. The historical percent changes for this age group are given by

$$\%C_{20-24}(1971,1976) = \frac{1,380.95 - 2,064.55}{2,064.55} \times 100\% = -33.11\%$$

$$\%C_{20-24}(1976,1981) = \frac{1,309.10 - 1,831.80}{1,831.80} \times 100\% = -28.53\%$$

$$\%C_{20-24}(1981,1986) = \frac{1,107.80 - 1,481.70}{1,481.70} \times 100\% = -25.23\%$$

$$\%C_{20-24}(1986,1991) = \frac{648.30 - 942.55}{942.55} \times 100\% = -31.22\%$$

$$\%C_{20-24}(1991,1996) = \frac{639.35 - 910.30}{910.30} \times 100\% = -29.76\%$$

$$\%C_{20-24}(1996,2001) = \frac{783.00 - 1,023.70}{1,023.70} \times 100\% = -23.51\%$$

The average percent change is approximately -28.56% . Using this value we can estimate the population of the 20-24 cohort in 2006 to be:

$$P_{20-24}(2006) = P_{15-19}(2001) \cdot [1 - 0.285627996253] = 994.35 \cdot [0.714372003747] = 710.34$$

If we have already calculated the projected population of 15-19 year olds in 2006, we can estimate the population of 20-24 year olds in South Country Health District in 2011 to be:

$$P_{20-24}(2011) = P_{15-19}(2006) \cdot [1 - 0.285627996253] = 747.462774974 \cdot [0.714372003747] = 533.97$$

, and so on.

Projected Population of 0 to 4 Year Olds

The predicted value of 0-4 year olds for 2006 is based on age and district specific fertility rates. A district specific table of births by mother's age for 1993-1997 was used to estimate the percentage of births for each five-year age group between 10 and 49 years of age. For example, in South Country Health District, 0.00% of births were to mothers aged 10 to 14, 7.83% to mothers aged 15-19, 26.47% to mothers aged 20-24, 35.16% to mothers aged 25-29, 23.32% to mothers aged 30-34, 6.54% to mothers aged 35-39, 0.56% to mothers aged 40-44, and 0.12% to mothers aged 45-49. The fertility rate for year t and age group n was calculated as

Saskatchewan Health Population Projections 2006 to 2021

$$F_n(t) = \frac{P_{0-4}(t)}{P_n(t-5)} * B_n,$$

where B_n is the percentage of total births due to mothers in age group n . The average of $F_n(1991)$, $F_n(1996)$, and $F_n(2001)$ was used to project the number of 0 to 4 year olds. For example, the number of 0 to 4 year olds in 2006 was projected as

$$P_{0-4}(2006) = \sum_{n=10-14}^{45-49} F_n(\text{avg}) * P_n(2001).$$

Projections of 0-4 year olds in 2011 are calculated as

$$P_{0-4}(2011) = \sum_{n=10-14}^{45-49} F_n(\text{avg}) * P_n(2006).$$

Exceptions

As stated above, in most cases, the average percent change over six time periods (1971 to 1976, 1976 to 1981, 1981 to 1986, 1986 to 1991, 1991 to 1996, and 1996 to 2001) is used to project the population of each age cohort. This section details the exceptions to this rule.

Percent Change for Persons Aged 75 and Older

It was noticed that in many districts there was a trend towards decreasing percent change for persons aged 75 and older over the thirty years of historical data. This is probably due to longer life expectancy among seniors. An average percent change would underestimate the projected population of seniors therefore a different method of calculating the percent change was used. The six historical percent change values were fit to the logistic function

$$2M - \frac{M}{[1 + Be^{-kt}]},$$

that has a graph of the following form:

Saskatchewan Health Population Projections 2006 to 2021

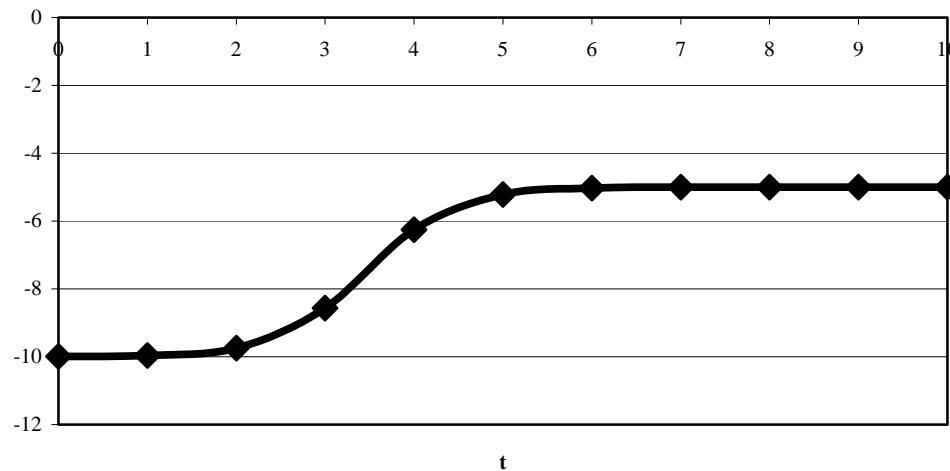

Figure 3: Logistic function

A curve of this type was chosen because although the percentage change for age groups greater than 75 is increasing, it cannot increase indefinitely and must eventually level out to a maximum value. For each district, the historical percent changes for each age group greater than 75 were fit to the logistic curve and this fit was used to estimate percent change for 2006, 2011, 2016, and 2021. If the percent changes did not show an upward trend, then an average percent change was used for projections.

Regina and Saskatoon Health Districts

The Regina and Saskatoon health district population projections only use 1991, 1996, and 2001 data for people aged 15 to 24 years because the large influx of rural residents in the 1970s and 1980s into these two cities is not expected to continue in the future because the rural districts have been largely depleted of these populations.

Districts with large variations in population

South East, Moose Jaw/Thunder Creek, Swift Current, and Parkland health districts have population values that fluctuate considerably making it difficult to make predictions of future populations. The population of South East Health District was projected using the average percent change

Saskatchewan Health Population Projections 2006 to 2021

from 1981 onwards, while the populations of Moose Jaw/Thunder Creek, Swift Current, and Parkland health districts were projected using the average percent change from 1991 onwards.

Districts with inaccurate allocation of Registered Indian Persons in the 1970's

The projections for Moose Mountain, Pipestone, Touchwood Qu'Appelle, Gabriel Springs, North-East and Northwest health districts are based on population data from 1981 onward. Because of a lack of postal code information for the 1970s data, the 1971 and 1976 populations do not accurately count the number of Registered Indian persons living in each of these districts. Since these districts have significant Registered Indian populations, they are more adversely affected by the inaccuracies in the 1970s data.

Northern Saskatchewan

Because of difficulties in assigning 1970s populations to the northern health districts and changes in the populations in the early 1980s, projections for Mamawetan Churchill River and Keewatin Yatthé health districts are based on populations from 1986 onward. Because of the decline in population of the Athabasca Health Authority in the 1970s and 1980s due to the closure of the Uranium City mine, population projections for this region are based on data from 1991 onward.

Confidence Interval Calculations

The confidence interval calculations for each district are based on the amount of variation in the percentage changes for each time interval. For each age group, the range in the percent change was calculated as the maximum percent change minus the minimum percent change. A lower bound for the percent change was calculated by subtracting half of the range from the percent change used for the projection. Similarly, an upper bound for the percent change was found by adding half of the range to the percent change used for the projection. For the 0-4 age group, an upper and lower bound for the fertility rate was calculated by adding and subtracting half of the range in fertility rates to the rate that was used for the projection. These upper and lower bounds in the percent change and fertility rates were then used in the projection equations to get upper and lower bounds for the population of each age group. In order to have the upper and lower bounds equidistant from the actual projection, the range of the upper and lower projections was calculated and then half of this range was added and subtracted from the actual projections to give the confidence intervals.

Saskatchewan Health Population Projections 2006 to 2021

Comparison with Statistics Canada Projections

This section compares Saskatchewan Health's population projections with Statistics Canada's version 2 projections (medium growth scenario) published in March of 2001^v. In the following table, individual cells are rounded so numbers may not add exactly to totals.

Table 1: Statistics Canada and Saskatchewan Health population projections

Statistics Canada March 2001 Population Projection 2 (Medium Growth Scenario)						Saskatchewan Health Population Projections					
Year	Total	Age Group				Total	Age Group				
		0 to 19	20 to 64	65 Plus	75 Plus		0 to 19	20 to 64	65 Plus	75 Plus

Saskatchewan Health Population Projections 2006 to 2021

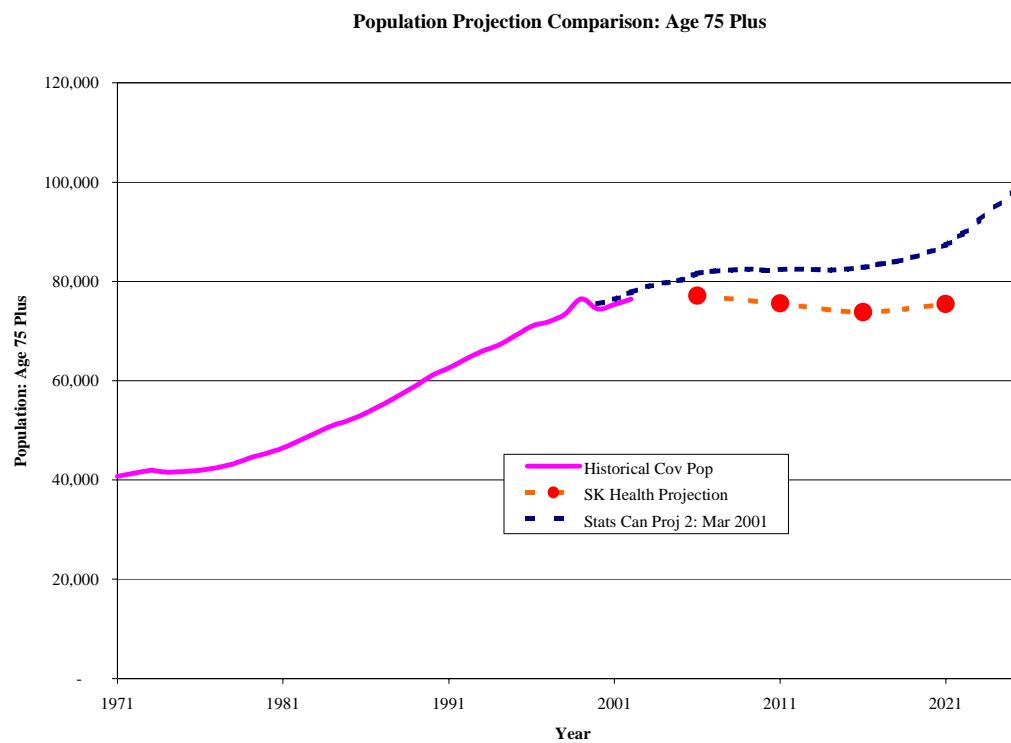

Figure 8: Comparison with Statistics Canada projections: Age 75 plus

Saskatchewan Health Population Projections 2006 to 2021

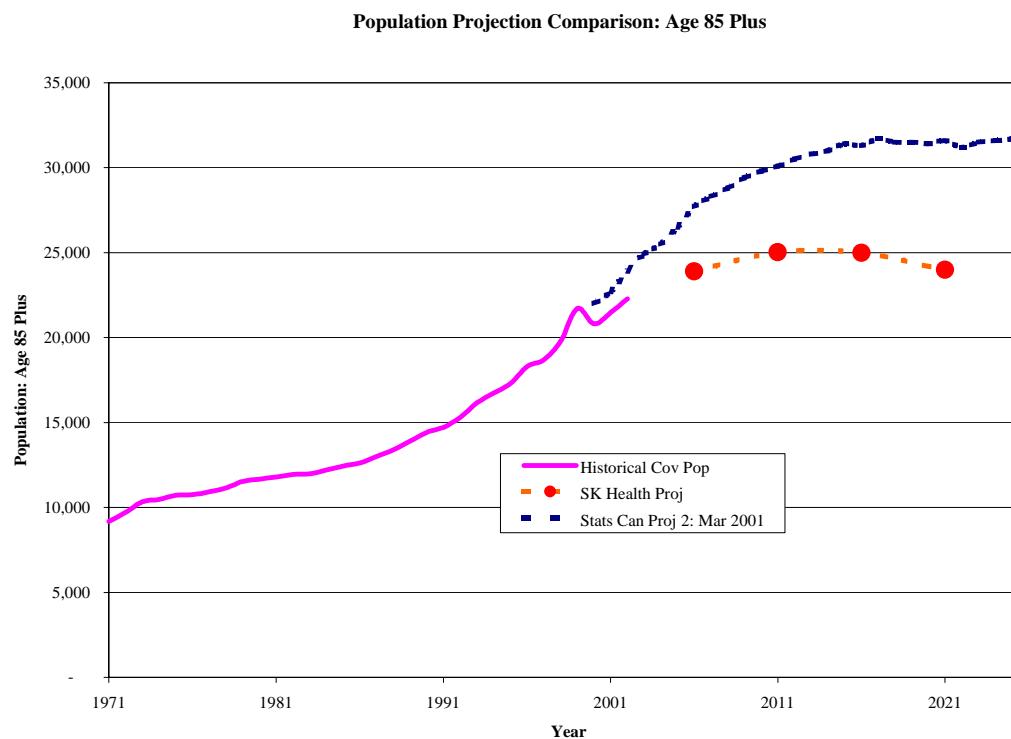

Figure 9: Comparison with Statistics Canada projections: Age 85 plus

Figures 4 to 9 compare Statistics Canada population projections with those of Saskatchewan Health. The projections for the totals shown in Figure 4 show that the Statistics Canada projections are slightly higher than Saskatchewan Health's in earlier years and are lower after 2016.

Saskatchewan Health is projecting higher numbers of people aged 0 to 19 than Statistics Canada. The trend for 20 to 64 year olds is very similar for both Statistics Canada and Saskatchewan Health. For seniors, the Statistics Canada projections are consistently higher than those of Saskatchewan Health and the differences become more pronounced for older seniors (aged 75 plus and 85 plus).

Saskatchewan Health Population Projections 2006 to 2021

Provincial Projections

The provincial population projections are the sum of the individual district projections.

Saskatchewan Health Population Projections 2006 to 2021

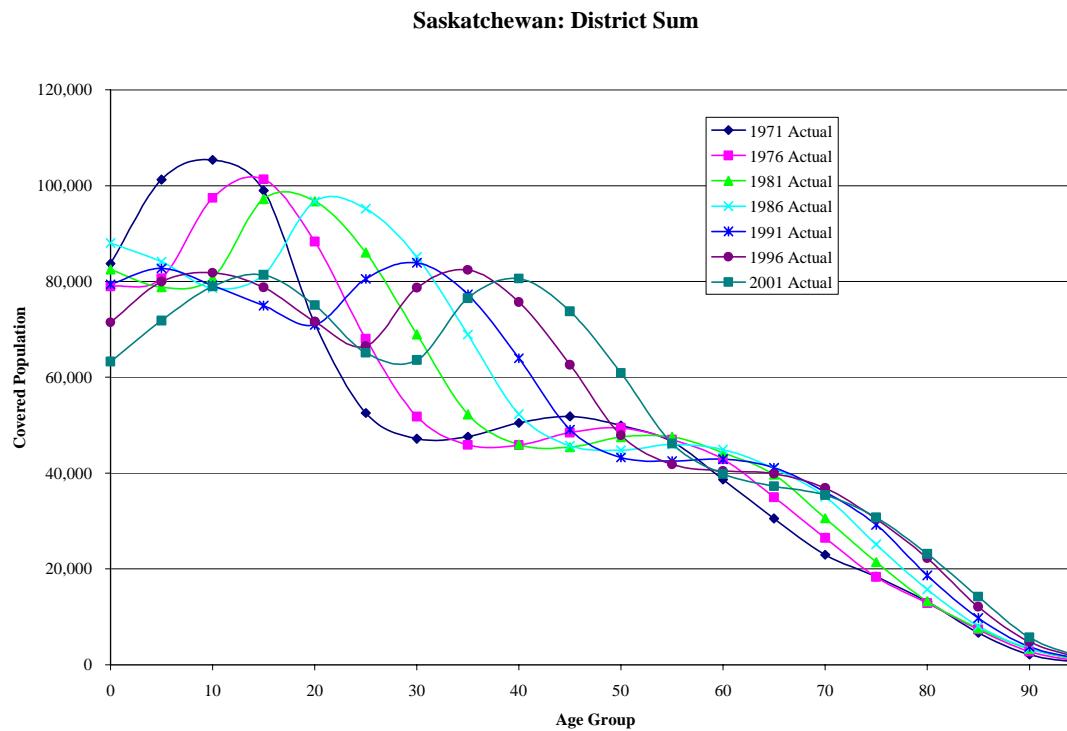

Figure 11: Historical age curves for the province of Saskatchewan

Saskatchewan Health Population Projections 2006 to 2021

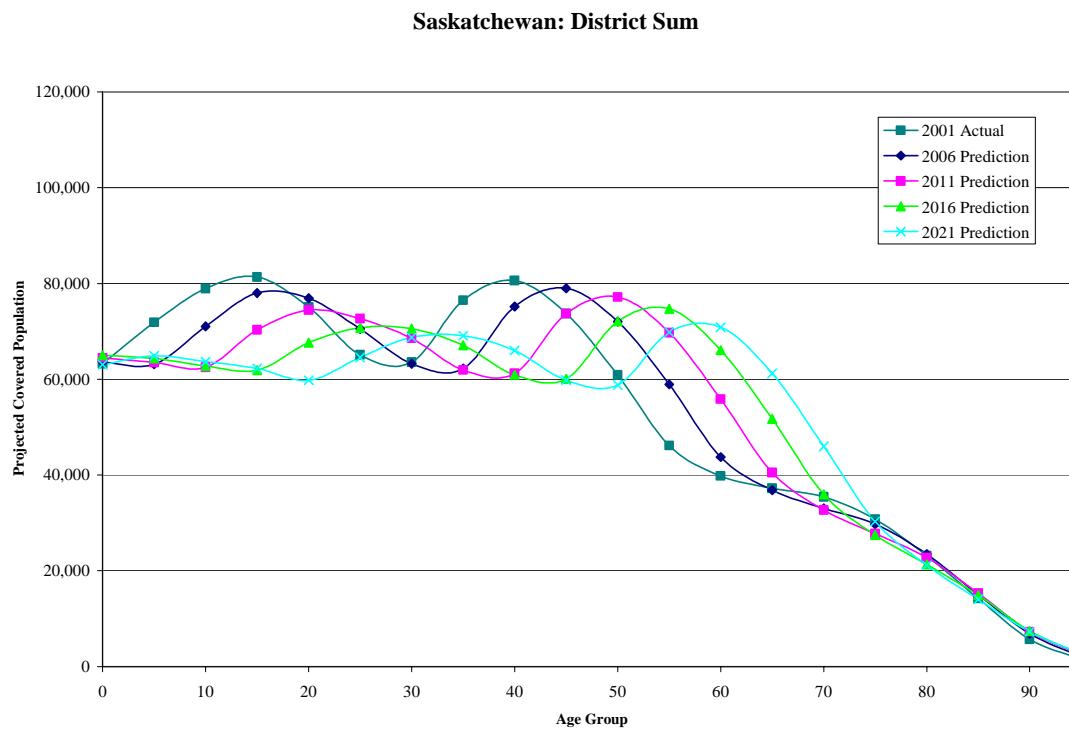

Figure 12: Projected age curves for the province of Saskatchewan

The previous two figures show historical and projected age curves for the province of Saskatchewan. These graphs allow one to follow an age cohort over time. For example, the dark blue curve in the first graph illustrates the age distribution of the population for 1971. The peak centred around the 10 to 14 age group is the baby boomers which is the easiest cohort to follow. Five years later, on the pink curve for 1976, the peak is centred around the 15 to 19 age group, and so on. In 2021, this peak is projected to be centred around the 60 to 64 age group.

Projections by Regional Health Authority

The projections by regional health authority are the sum of their component district projections. The individual district projections are contained in the appendix of this document.

Saskatchewan Health Population Projections 2006 to 2021

Figure 31: Projected age curves for Saskatoon Regional Health Authority

Saskatchewan Health Population Projections 2006 to 2021

Projections for Heartland Regional Health Authority

Heartland Regional Health Authority is made up of:

- [Midwest Health District](#),
- [Prairie West Health District](#), and
- [Greenhead Health District](#).

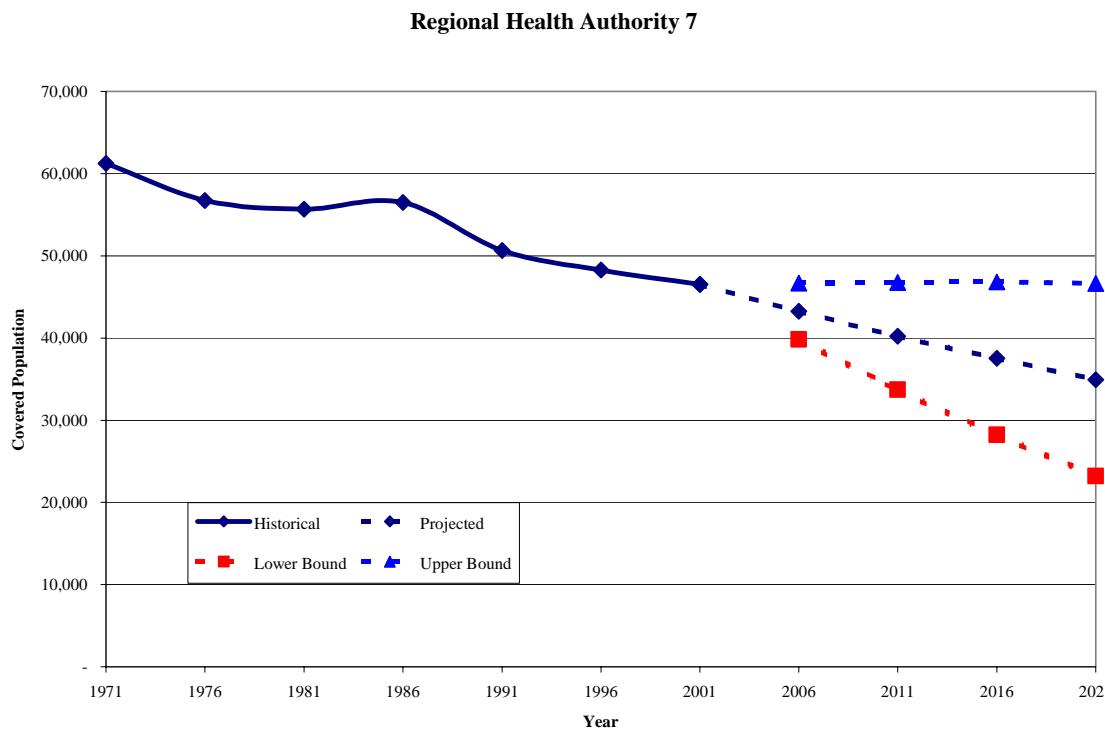

Figure 32: Total population of Heartland Regional Health Authority: historical and projected
