# PREAMBLE

## 1. Introduction

In 1992, the World Administrative Radio Conference (WARC-92) allocated the frequency band 1452-1492 MHz (L-Band) to the broadcasting and the broadcasting satellite services, for digital audio broadcasting.

In September 1992, a government/industry Task Force was created by the then Minister of Communications and was given the mandate to provide advice and make recommendations on a broad range of issues related to the introduction of digital radio broadcasting (DRB) in Canada. The report of this Task Force was submitted on November 15, 1995.

Issue 1 of the Allotment Plan for Digital Radio Broadcasting (DRB) was published on June 15, 1996. Since then, agreement was reached with the US on the coordination of Canadian Terrestrial Broadcasting at 1452-1492 MHz and U.S. Aeronautical Telemetry at 1435-1525 MHz. The agreement provides protection to the spectrum required for the implementation of terrestrial DRB in Canada, thus ensuring smooth transition to the digital service and orderly growth. For convenience, the text of the [agreement](#), is reproduced in Annex 2 of this document.

In addition to the agreement, two other factors necessitated changes to Issue 1 of the plan. These are: addressing the need of the CBC to meet its national mandate and providing a digital allotment for the new AM and FM stations since January, 1996. These changes are reflected in issue 2 which addresses only allotments for terrestrial DRB. While some previous digital allotments remained unchanged during this process, others were provided on different channels. The impact on some existing fixed service stations has changed as a result of this revision.

The following principles and other criteria related to the Plan which were discussed in the preamble for Issue 1 of the Allotment Plan have been updated and repeated here for convenience.

Throughout the process of planning, the Spectrum Engineering Branch of Industry Canada kept in close consultation with representatives of the Canadian Broadcasting Corporation and the Canadian Association of Broadcasters as well as with other members of the Joint Technical Committee on Advanced Broadcasting (JTCAB) working groups.

## **2. Planning Principles**

The planning principles enunciated by the Task Force, which were prepared in consultation with Working Groups of the JTCAB and used in Issue 2 of the Plan, included the following:

- S DRB should be introduced as a replacement service to AM and FM services
- S for FM stations, the plan should accommodate DRB facilities which will provide for replacement of their existing coverage and have the potential to expand to the highest class of FM station in the community
- S for wide-coverage AM stations, the plan should accommodate stereophonic DRB facilities equivalent to the highest Class of FM station in the community. For limited coverage AM stations, the plan should permit replacement of existing coverage, with potential to expand to the highest class FM station in the community
- S provision should be made for additional terrestrial DRB services
- S there should be provision for ancillary services
- S provision should be made for a satellite component

To the extent possible, these principles were taken into account in the development of the terrestrial DRB Allotment Plan, Issue 2.

## **3. The Plan**

Initially, the DRB Service will operate in parallel with the existing AM and FM services which will be phased out at an appropriate time in the future.

The Plan, as published, provides for a digital allotment for each AM and FM broadcasting station, allotment and application existing as of August 31, 1998. However, the continued availability of a digital allotment for any AM or FM station will depend on the applications received for the digital service and any modifications made to the Plan during the licensing process. It should be noted that in many locations in Canada, the Plan contains vacant allotments that can accommodate AM or FM stations applied for after August 31, 1998 and to allow a measure of future growth.

The allotments in the Plan are listed by Province/Territory/ Group ID. In addition, Annex 1 lists the Group ID and the call signs of the AM/FM stations that were placed in each group during the development of the Plan. This list is intended for information only and will not be published in the final version of the plan.

Making assumptions about possible station grouping was a technical pre-requisite to developing the Plan. The groupings shown were based only on similarities in coverage areas. It is recognized, however, that for various other reasons, rearrangement in the groupings may be desirable. Industry Canada has no objection to regrouping provided that the integrity of the Plan, i.e. spectrum efficiency, digital service areas and frequency re-use contours, is not compromised. Accordingly, any changes in groupings may be addressed at the time of the licensing process.

The 40 MHz between 1452 and 1492 MHz has been channelized into 23 DRB channels with a guard band of 208 kHz between adjacent channels and a 48 kHz guard-band at the band edges. The channels have been numbered from 1 to 23 with centre frequencies as tabulated below:

DRB Channel	Frequency	DRB Channel	Frequency	DRB Channel	Frequency
1	1452.816	9	1466.768	17	1480.72
2	1454.56	10	1468.512	18	1482.464
3	1456.304	11	1470.256	19	1484.208
4	1458.048	12	1472	20	1485.952
5	1459.792	13	1473.744	21	1487.696
6	1461.536	14	1475.488	22	1489.44
7	1463.28	15	1477.232	23	1491.184
8	1465.024	16	1478.976		

Note: Use of channels 18-23, West of 83.25° West Longitude and East of 68° West Longitude will be on a non-protected basis and may require coordination with US MAT Services (See Annex 2 or view at: <http://spectrum.ic.gc.ca/drb/engdoc/index.html> ).

There are two characteristics of the EUREKA-147 (DAB) system adopted in Canada which require explanation to facilitate understanding of the Plan and the implementation of this form of digital radio. In order to alleviate multipath effects, particularly for mobile reception, which is considered to be the most critical receiving environment, the data in a DRB channel is distributed over 1.5 MHz bandwidth. This channel can accommodate five stereophonic programs with CD-quality and will also have capacity for ancillary services. This is reflected in the attached Plan where up to 5 existing AM and/or FM broadcasters are grouped together to share the same transmitting facility.

Another characteristic that affects implementation allows the use of low power on-channel repeaters within service areas to fill gaps in coverage, the use of on-channel repeaters near the periphery of a service area to extend coverage, and Single Frequency Networks to provide a service area of virtually any size or shape. This flexibility allows systems to be implemented in phases, starting with a single transmitter covering the core market within the DRB service area and expanding coverage at a later date.

The following methodology was generally used in the development of the allotment plan:

- S the 0.5 millivolt/metre contour of each existing FM station was recalculated using digitized topographical terrain data, where available, in order to determine a more realistic contour. For AM stations, the measured 0.5 millivolt/metre daytime contours were used.
- S up to five existing stations or allotments with similar coverage areas were placed in a group and given a unique **Group ID**. AM stations with wide area coverage were treated as if they were FM stations of the highest class in the community. All existing assignments including those with low power were accommodated as well as all existing allotments.
- S a replacement Digital Service Area (**DSA**) was determined for each **Group**, approximating the coverage of the AM/FM stations forming that **Group**.
- S a DRB coverage area approximating each **DSA** was synthesized using an assumed ensemble of transmitters with appropriate operating parameters. The coverage target was 90% of the locations within the **DSA** for 90% of the time at a receive antenna height of 1.5 metres. This receive antenna height is suitable for reception in automobiles.

- S a Frequency Reuse Contour (**FRC**) was generated for each **DSA** based on each ensemble of transmitters. The **FRC** was not allowed to overlap more than 1% of another **DSA** allotted the same DRB channel. The **FRC** has a value of 42 dB above 1  $\mu$ Volt/metre, not to be exceeded at more than 10% of the locations, 10% of the time.
- S the **FRC** and **DSA** are essential elements in the allotment plan. The ensemble of transmitters and the resultant DRB coverage contour associated with each **DSA** no longer have a use and are therefore not part of the plan. However, they will be retained for reference purposes.
- S once the **FRCs** were determined, one of the 23 DRB channels was assigned to each **Group** by a computer program designed to optimize frequency spectrum usage. In assigning the DRB channels, all 23 channels were needed in the concentrated areas of Ontario and Quebec and the first 17 channels were used outside these areas in order to ensure protection from US MATS operation (see Annex 2). Further, it was not possible to set spectrum aside for satellites.
- S In rare cases, allotments had to be short-spaced. In these cases, the actual percentage of interference, i.e. overlap received or caused, in excess of the 1% target is noted in the plan.
- S In addition, wherever possible, the Department avoided allotting a channel which could conflict with assignments in the fixed service operating in the adjacent bands.

One of the difficulties encountered in the development of the Plan was the lack of complete information on some aspects of planning. For example, the **FRCs** were generally determined by a computer program which took terrain elevation data into consideration. Where such data were not available the **FRC** had to be estimated by other means. Also, the front-end characteristics of DRB receivers are not known since they have yet to be specified, so assumptions had to be made in this regard. Factors such as these will require a review of the Plan when additional information becomes available.

#### 4. Use of Channels in the Plan

Applicants will have to ensure that their design of the transmitting facilities produces a frequency reuse contour which does not exceed the **FRC** for the particular **Group** they choose. In the event the proposed frequency reuse contour does exceed the **FRC**, the broadcasters will have to demonstrate that it does not overlap more than 1% of the **DSA** of another **Group** allotted the same DRB channel. Note that, in many cases, the **FRC** is made up of multiple contours comprising 'islands' of potential interference which are located outside the primary contour.

There is a [datafile](#) which can be used with the MAPINFO<sup>®</sup> program to generate diagrams showing the **FRC** and **DSA** for each **Group**. These diagrams also include information on the grids used to generate the **FRCs**. Each grid consists of a matrix of 40 by 40 points. Provided on each of the diagrams are: the horizontal span of the grid, a reference point on the grid and the horizontal and vertical offsets of the reference point from the centre of the grid.

The files are available electronically at the following address:

<http://spectrum.ic.gc.ca/infoback/dgse/english/bprs.html>

Issue 1 of the allotment plan contained a list of fixed systems operating in the 1452-1492 MHz band that could be impacted by DRB. However, additional analysis in the Department and industry has led to the application of revised interference criteria. It is expected that additional existing fixed systems will be identified as potentially affected by DRB in this band. A revised list of these potentially impacted fixed

systems will be published in the near future.

In addition, the above studies have indicated potential adjacent channel interference between DRB and fixed systems operating on frequencies adjacent to the 1452 to 1492 MHz frequency band. In this regard, these adjacent channels were avoided during the re-planning, to the extent possible. However, in the remaining cases, the actual impact and mitigation techniques will depend on each situation. A coordination procedure for adjacent channel interference cases is being developed in conjunction with industry and this will be published in the near future.

# TABLE OF DRB ALLOTMENTS

November, 1998

Allotments listed by Province/Territory  
and by city, alphabetically

The allotments in this Table are listed alphabetically by province/territories/group. Each allotment has a unique Group number comprising the province abbreviation and a two or three-digit number. Annexed to the Plan is a listing showing, for each Group, the call signs of the AM/FM stations that were placed in it during the development of the Plan. Information reflects status as of August 31, 1998.

## Explanatory Notes

The Headings of the columns in the table of the Plan have the following meanings:

CH: DRB channel #

PROVGRP: This column identifies provinces /territories and group number as follows:

BC#: British Columbia  
AB #: Alberta  
SA #: Saskatchewan  
MB#: Manitoba  
ON#: Ontario  
QU#: Quebec  
NB #: New Brunswick  
NS#: Nova Scotia  
PE#: P.E.I.  
NF#: Newfoundland  
YT#: Yukon Territory  
NT#: Northwest Territory

CITY\_VILLE: City name

IRBA : Interference Received Above 1% Threshold

ICBC : Interference Caused Above 1% Threshold

# TABLEAU DES ALLOTISSEMENTS DRB

Novembre 1998

Allotissements donnés par  
province/territoire et par ville, en ordre  
alphabétique

Le Plan donne la liste des allotissements par ordre alphabétique, par province/territoire/groupe. Chaque allotissement possède un numéro particulier de groupe qui contient l'abréviation de la province et un numéro de 2 ou 3 chiffres. Le Plan contient aussi une annexe qui fournit pour chacun des groupes, l'indicatif d'appel des stations AM/FM qui ont été placées dans le groupe au cours du développement du Plan. Les renseignements reflètent l'état du Plan au 31 août 1998.

## Notes explicatives

Les en-têtes des colonnes figurant dans le tableau du plan ont les significations suivantes:

CH: No. de canal DRB

PROVGRP : Cette colonne identifie les provinces/territoires et les numéros de groupe comme suit :

BC#: Colombie-Britannique  
AB#: Alberta  
SA#: Saskatchewan  
MB#: Manitoba  
ON#: Ontario  
QU#: Québec  
NB#: Nouveau-Brunswick  
NS#: Nouvelle-Écosse  
PE#: Île-du-Prince-Édouard  
NF#: Terre-Neuve  
YT#: Territoire du Yukon  
NT#: Ter. du Nord-Ouest

CITY\_VILLE: Ville

IRBA : Brouillage reçu au-dessus du seuil de 1 %.

ICBC : Brouillage produit au-dessus du seuil de 1 %.

# ANNEX1/ ANNEXE 1

## Group and Call Signs Listing

This Annex contains a listing showing, for each Group, the call signs of the AM/FM stations that were placed in it during the development of the Plan.

PGM1, PGM2,...,PGM5 are the call signs of the AM and FM stations in the group. "NEW" or "NOUVEAU" refer to a station not yet operating, to which, a call sign has not been assigned. "AL" means "allotment"; it refers to either a vacant AM or FM allotment or to available space in the group.

Information reflects status as of August 31, 1998.

## Liste des groupes et des indicatifs d'appel

La présente annexe fournit, pour chacun des groupes, l'indicatif d'appel des stations AM/FM qui ont été placées dans le groupe au cours du développement du Plan.

Les colonnes PGM1, PGM2,...,PGM5 correspondent aux indicatifs d'appel des stations AM et FM qui sont dans le groupe. Les termes « NEW » ou « NOUVEAU » font référence à une station qui n'est pas encore en fonctionnement et à laquelle un indicatif d'appel n'a pas été assigné. Le sigle « AL » signifie allotissement et fait référence à un allotissement AM ou FM inoccupé ou à une place disponible dans le groupe.

Les renseignements reflètent l'état du Plan en date du 31 août 1998.

## **ANNEX 2**

### **Terms of Agreement on Coordination of Canadian Terrestrial Broadcasting at 1452-1492 MHz and U.S. Aeronautical Telemetry at 1435-1525 MHz**

This agreement deals specifically with the Canadian Terrestrial Broadcasting at 1452-1492 MHz and U.S. Mobile Aeronautical Telemetry Service at 1435-1525 MHz.

Canada is no longer pursuing a frequency allocation for Mobile Satellites in the 1435-1525 MHz band.

In the event that Canada would want to implement a broadcast satellite in the 1452-1492 MHz band a separate agreement would need to be negotiated regarding coordination and use of the satellite. Implementation of a broadcast satellite service could only proceed subsequent to completion of such an agreement between Canada and the U.S. Any such agreement would have to fully protect the interference-free use of the 1435-1525 MHz band for aeronautical telemetry by the United States.

The U.S. requires the entire band 1435-1525 MHz for its aeronautical telemetry operations. Canada requires the entire band 1452-1492 MHz to implement terrestrial digital radio broadcasting (T-DRB). However, because of the geographic location of the principal operations, the United States is able to coordinate with Canadian terrestrial broadcasting stations in certain geographical areas as contained in this agreement. In order to meet its requirements for aeronautical telemetry, the United States must maintain the availability of the remainder of the band in the areas near the border, and the entire 1435-1525 MHz band for the rest of the United States.

The U.S. has current and continuing firm requirements for use of the full 90 MHz of spectrum, 1435-1525 MHz, for Aeronautical Telemetry (ATM). Canada has firm commitments to use 40 MHz of this same band, as indicated in this agreement, for T-DRB to provide a digital service for each AM and FM station. The signal strengths and receiver sensitivities associated with ATM and T-DRB operations are such that the use of the same frequencies for both operations, in the same locations, is not possible. The operation of both types of systems in the same geographic areas therefore requires that the available spectrum be subdivided and used on an exclusive basis. Thus, portions of the band will not be available to each of the users in certain geographic areas.

Because of the geographic distribution of U.S. ATM ground receiving sites and the ATM traffic requirements at these various sites, it is deemed possible to accept sufficient constraints on U.S. ATM use in the area of the U.S./Canada border, to accommodate Canadian use of a portion of this band to T-DRB. Also because of these geographically-differing station locations, the amount of spectrum that can be protected for Canadian T-DRB use is not the same for all locations along the common border. The specifics of the protection agreement set forth below detail this situation, and describe the sub-bands and locations that can be protected. Specifically, the United States has a firm long term requirement to operate in the 1435-1452 and 1483-1525 MHz band along the United States/Canada border except in certain locations as described in this agreement. This provides for 40 MHz contiguous broadband spectrum (plus 2 MHz of guardians) for broadband ATM assignments.

This agreement is predicated on the assumption that the ATM spectrum that is not protected for Canadian T-DRB will continue to be useable for U.S. ATM operations throughout the country, and especially in the northern portions of the U.S. Any additional reduction of ATM spectrum in this band beyond that covered by this agreement would seriously and unacceptably degrade U.S. ATM operations.

In furtherance of this agreement the following shall apply:

16. West of 83.25°, and East of 68° West Longitude:

- a. United States use of 1452-1483 MHz will be on a non-interference basis to Canadian T-DRB receiving stations whenever United States transmitters are within radio line-of-sight (4/3 earth radius) of the United States/Canada border. Canadian T-DRB will not protect United States ATM receivers in this band, it being understood that the EIRP of a T-DRB transmitter located in Canada will not exceed, towards the United States, 50 kW at an effective antenna height above average terrain of 1500 metres, or the equivalent balance of power and antenna height.
- b. The Canadian use of 1483-1492 MHz will be on a non-interference basis to United States mobile telemetry ground stations whenever Canadian transmitters are within radio line-of-sight (4/3 earth radius) of the United States/Canada border. United States telemetry transmitters will not protect Canadian T-DRB receivers in this band.

2. East of 83.25°, and West of 68° West Longitude:

The United States use of 1452-1492 MHz will be on a non-interference basis to Canadian T-DRB receiving stations whenever United States transmitters are within radio line-of-sight (4/3 earth radius) of the United States/Canadian border. Canadian T-DRB will not protect United States ATM receivers in this band, it being understood that the EIRP of a T-DRB transmitter located in Canada will not exceed, towards the United States, 50 kW at an effective antenna height above average terrain of 1500 metres, or the equivalent balance of power and antenna height.

3. No United States ATM operations will be conducted in the protected band(s) within Radio Line-of-Sight (RLOS) of the Canadian border without prior coordination and approval of Canada.
4. West of 83.25° West longitude, certain United States ATM transmitters and receivers in the states of Washington, Idaho and Montana will continue to operate in the 1452-1483 MHz band for a minimum of 24 months from entry into force of this agreement without affording protection to Canadian T-DRB operations. After 24 months, Canadian T-DRB operations would be protected from U.S. aeronautical telemetry when Canada advises the U.S. that T-DRB in a given area is ready to be brought into use. Both parties may agree to an earlier implementation of T-DRB transmitters on a case-by-case basis.
5. It is understood that this agreement can be reviewed at the request of either party.
