ALBERTA NATURAL HERITAGE INFORMATION CENTRE

PRELIMINARY LICHEN TRACKING LIST

Compiled Joyce Gould
May, 2000

This list contains the preliminary tracking and watch lists for both macro- and micro-lichens as developed by the Alberta Natural Heritage Information Centre (ANHIC), Alberta Environment. The lichen flora in Alberta is not particularly well documented and thus these lists should be viewed as preliminary in nature. We encourage submission of locational information for any of the taxa on either the tracking or watch lists as such information will be used to help us revise these lists. A Rare Native Plant Report Form is attached for your convenience.

Background

The ANHIC was initiated as a joint project of The Nature Conservancy, Canadian Heritage, Alberta Region and Alberta Environmental Protection. It is housed within the Parks and Protected Areas Division of Alberta Environment. The ANHIC has established both formal and informal links with organizations and individuals with expertise and information about plants in Alberta. The Devonian Botanic Garden of the University of Alberta is an affiliate.

The purpose of the Centre is to collect, evaluate and make available information on the elements of native biodiversity of Alberta—plants, animals, natural communities and landscapes. This is done in part through the production of tracking and watch lists.

Tracking and Watch Lists

Tracking lists include elements of high priority because they are rare or of conservation concern in some other way. They are most commonly ranked S1, S2 and occasionally S3 (see below for an explanation of ranking). Data for those species on the tracking lists are entered into a series of data files and linked to a geographic information system. Watch lists include elements for which we want to collect more information but for which data is compiled rather than processed to the fullest extent. The tracking and watch lists are under constant review and revision based on available data and will be updated and published on a periodic basis.

Various sources of information including published and unpublished literature, field surveys, herbarium specimens, rare plant files and discussions with knowledgeable individuals were used to produce this preliminary list. The tracking and watch lists are organized alphabetically by scientific name.

Several individuals have assisted in the production of the list through review of ranks and/or taxonomy and their assistance is gratefully acknowledged: Peter Achuff, C. D. Bird, Ernie Brodo, Jim Case, D. Coxson, Trevor Goward, Roxanne Hastings, Derek Johnson, Olivia Lee, Janet Marsh, Bruce Ryan, J. Sheard, John Thomson and C. Wetmore. Beth Cornish helped coordinate the data compilation required for the production of this list.

Species that are on the watch lists are typically taxa that have restricted distributions within Alberta but are common within their range. Information is collected to ascertain trends in populations. We may decide to move a species from the watch list to the tracking list if information suggests that the species be in decline. Please submit a Rare Native Plant Report Form for those taxa included on the watch lists.

Rank

Elements are evaluated and ranked on their status (globally and state/provincially) using a system developed by The Nature Conservancy which is in use throughout North America. Ranking is usually based primarily on the number of occurrences, since that is frequently the only information available. Information, such as population size and trend, life history and reproductive strategies, range and current threats is used when available. The ranks in Alberta are defined as:

RANK (G=global; S=Alberta)

- G1 S1: \leq 5 occurrences or only a few remaining individuals.
- G2 S2: 6-20 occurrences or with many individuals in fewer occurrences.
- G3 S3: 21-100 occurrences may be rare and local throughout its range, or in a restricted range (may be abundant in some locations or may be vulnerable to extirpation because of some factor of its biology).
- G4 S4: apparently secure under present conditions, typically >100 occurrences but may be fewer with many large populations; may be rare in parts of its range, especially peripherally.
- G5 S5: demonstrably secure under present conditions, > 100 occurrences, may be rare in parts of its range, especially peripherally.
- GU SU: status uncertain often because of low search effort or cryptic nature of the element; possibly in peril, unrankable, more information needed.
- GH SH: historically known, may be relocated in the future.

Other codes are:

- E: exotic species established, may be native to nearby regions
- HYB: hybrid taxon that is recurrent in the landscape
- P: potentially exists; may have occurred historically (but having not been persuasively documented)
- Q: taxonomic questions or problems
- R: reported but lacking sufficient documentation to accept or reject
- RD: report dubious
- RF: reported falsely
- T_: rank for a subspecific taxon
- X: believed to be extirpated
- G? or S?: not yet ranked
- _?: rank questionable

Updates and Additional Information

We are asking for your help in keeping our databases as accurate and up-to-date as possible. If you discover any new occurrences of species on this list, please submit a Rare Native Plant Report Form. Feel free to notify us of any inaccuracies or discrepancies you may notice in our data, or if you have comments on the rank, and give us your suggestions on how our services could be more useful to you.

Information on the ANHIC is available through the Internet at <http://www.gov.ab.ca/env/parks/anhic/anhic.html> or by contacting:
