Skuas and Jaegers				
○ Great Skua	-	-	H	-
○ Pomarine Jaeger	-	-	R	-
○ Parasitic Jaeger	-	A	R	-
○ Long-tailed Jaeger	-	H	-	-

Blue Jay

While in its 1977 spring session, the Prince Edward Island legislature officially declared the Blue Jay as avian emblem for the province. During Environment Week of 1976, the Natural History Society of Prince Edward Island sponsored a public vote to determine the popular candidate. The Blue Jay was the landslide winner.

Although it is common on the Island year-round, the Blue Jay is most noticeable in winter when visiting bird feeders. It nests in secluded woodlands and keeps relatively quiet during spring and summer.

Bird Reports

The Natural History Society of Prince Edward Island retains and publishes records of bird sightings in its newsletter, the *Island Naturalist*. These records are used to update the Island's *Field Checklist of Birds*. The Society would appreciate the assistance of all birders in the submission of sightings to the Society, particularly the records of any bird not found on the list, any bird which is rated as U, R, O, A, H, or IR, reports of unusual behaviour, or colour abnormalities. Please submit these sightings to: Natural History Society of Prince Edward Island, c/o Dan McAskill, Charlottetown RR # 5, Donagh, P.E.I. C1A 7J8, fax 902-628-6331, or e-mail <nhspei@isn.net>.

For rare sightings and first records it would be helpful if you could submit the following information: species; observer's name(s), address, postal/zip code, and phone number with area code; date (write out month) and time of observation; duration of observation; type of optical equipment used; weather conditions; locality where the bird was seen; a description of the habitat and where the bird was seen in the habitat; distance from which the bird was observed; a description of the bird's size, bill shape, colouration on various parts (head, neck, eye colouration or stripes, back, wings, wing bars, underparts, tail shape, and legs), what the bird was doing, vocalizations, distinguishing features from other species, and your experience in birding. Any sketches made at the time of the observation, photographs, and especially video close-up you have would be very helpful. Sighting report forms are available from the Society or on the Society's web page <www.isn.net/~nhspei>.

Emblems of the Island

Bird - Blue Jay

Flower - Stemless Lady's Slipper

Tree - Red Oak

Bird-watching Locations

Most of the birds listed in this provincial bird checklist can be found within Prince Edward Island National Park of Canada where diverse habitats provide a natural haven for birds. Established in 1937 to protect a representative example of the Maritime Plain natural region, the Park features dune-edged beaches, barrier sand spits, forested till uplands, barachois ponds and salt marshes. Canada's national parks protect and preserve our natural heritage for the benefit of all Canadians, now and in the future.

Parks Canada's main objective is to ensure the ecological integrity of the Park, which means keeping natural habitats safe and intact for wildlife. To monitor the bird life within the Park throughout the year, Parks Canada staff are interested in documenting bird observations. If you are interested in contributing, please enquire about obtaining the "Volunteer Bird Census Record Form". For more information on bird-watching in Prince Edward Island National Park please call 902-566-7050 or check the Parks Canada web site at <www.parkscanada.gc.ca/pei>.

To find out about other good bird-watching locations in Prince Edward Island check the provincial web site at <www.gov.pe.ca/birds>.

Bird-watching Etiquette

Wherever you go in search of our feathered friends, you can help ensure their continued survival by following a responsible bird-watching etiquette:

- Please respect all signs to protect the piping plover, an endangered species that nests on several beaches on the Island.
- Please avoid trampling sand dunes or other sensitive areas; stay on designated trails whenever possible.
- Please leave berries, leaves and plants in place; they are food for birds and other wildlife.
- Please avoid disturbing shorebirds when they are feeding along the shore.
- Please do not disturb nesting birds by approaching nests too closely.

Acknowledgements

Records used to compile and revise the checklist were derived from numerous sources including: Natural History Society of Prince Edward Island, University of Prince Edward Island, PEI National Park, PEI Department of Fisheries, Aquaculture and Environment (Conservation and Management Division), PEI Department of Agriculture and Forestry and the records of many individual observers. The 2003 revision was completed by Dan McAskill and Ray Cooke. A special thanks to Rosemary Curley, Randy Dibblee, Les Homans, Eric Marcum, Barry Martin, Dwaine Oakley and David Seeler for their comments on the 6th Edition. We gratefully acknowledge all organizations and individuals who, through their contributions of sightings, made this update possible.

Extinct Species to Prince Edward Island

Passenger Pigeon

Extirpated Species to Prince Edward Island

Spruce Grouse

Note 1: Significant numbers of shearwaters, storm-petrels, and phalaropes have been reported in late summer and early autumn several miles offshore in northeastern and eastern Prince Edward Island.

Note 2: A January 2003 report of a hummingbird as well as sightings of species other than the Ruby-throated Hummingbird in Nova Scotia suggests other species are present here during migration.

Note 3: Only one nesting record of the Cliff Swallow has been reported in 20 years. Please report any Cliff Swallow nests you find.

Note 4: Due to a lack of documentation, the Varied Thrush has been removed from the list.
