

Consumer Price Index ♦ December 2004

Highlights – Annual Averages

- British Columbia's annual average all-items Consumer Price Index was 2.0% higher in 2004 than in 2003. The lowest annual increase was seen in Alberta at 1.4%, while Saskatchewan had the highest increase at 2.2%. Nationally, consumer prices rose 1.9% from 2003.
- Of the metropolitan areas, annual average price increases from 2003 ranged from a low of 1.0% in Edmonton, to a high of 2.2% in Charlottetown and Regina. Over the same period, the Vancouver CPI rose 2.0%, while Victoria prices rose 2.3%.
- Tuition fees and energy prices were the main contributors to BC's annual inflation. Tuition fees rose 21.1% in 2004, after a 23.1% rise in 2003. Fuel oil prices rose 12.6% while gas at the pumps cost 10.6% more in 2004 compared to 2003. Smokers paid 5.9% more for cigarettes, and alcohol prices rose 4.2%. Electricity prices rose 5.0%, while natural gas prices dropped 1.7%, after a 12.6% rise in 2003.
- Modest price increases were seen in 2004 for health and personal care (+1.8%), food (+1.3%), household operation and furnishings (+0.5%), and clothing and footwear (+0.5%).
- BC's 2004 annual average CPI, excluding food and energy, rose 1.7% from 2003. The comparable figure for Canada was 1.2%.

Note: Statistics Canada will release the January Consumer Price Index on February 22, 2005.

1992=100	Index	% Change from	
	December 2004	November 2004	December 2003
Canada	125.4	-0.2	2.1
BC	123.5	-0.2	2.2
Vancouver	124.2	0.0	2.1
Victoria	123.6	-0.2	2.4
Core Canada ¹	125.2	-0.1	1.7

Inflation Trend Drops at End of Year

1992=100	2004 Annual Average Index	2004 Annual Average % Change	2003 Annual Average % Change
Canada	124.6	1.9	2.8
BC	122.8	2.0	2.1
Vancouver	123.4	2.0	2.0
Victoria	122.8	2.3	2.2

¹**The Core CPI for Canada:** Defined by the Bank of Canada as the All-items index excluding the eight most volatile components (fruit, vegetables, gasoline, fuel oil, natural gas, mortgage interest, inter-city transportation and tobacco products). Also excluded is the effect of changes in indirect taxes on the remaining components.

Consumer Price Index—Terms and Definitions

Base Effect

The 12-month variation in the CPI is calculated by comparing the current month's index with the index for the same month of the previous year. The 12-month change is represented by the difference in the indexes of the reference months. Thus, the 12-month variation can decrease from one month to the next merely because the base serving as the point of comparison increased.

Twelve-Month Percent Changes

Also referred to as “year-over-year”, twelve-month percent changes compare indexes for a given month to indexes for the same month of the previous year. As they compare two points in time, they are influenced by unusual or temporary events that can affect either of the two months. Their calculation does not include any of the intervening monthly indexes.

Annual Average Index

Annual average indexes are calculated by averaging index levels over the 12 months of the calendar year. These data should not be confused with the 12-month change in the CPI. By the nature of the calculation, averaging indexes over the calendar year gives a better representation of price behaviour over the whole year and is closer to the concept of an average price. The use of annual averages is considered the preferred option for indexation purposes.

Latest Twelve-Month Average Index

The latest twelve-month average index (ending in the current month) is a 12-month moving average of the indexes of the most recent 12 months. It is calculated like the annual average index. Hence, in theory, the December twelve-month average index would be equal to the annual average index for the calendar year. However, in practice, when BC STATS makes these calculations from published data, the December 12-month average index may differ from Statistics Canada's published annual average index due to rounding.

Changes to the Treatment of Rebates in the Consumer Price Index

Beginning with the Consumer Price Index for October 2003, Statistics Canada will change its treatment of rebate payments. The change will affect some types of rebate programs usually related to electricity or natural gas utilities.

Rebates will no longer be reflected in the CPI if they are paid on the basis of past consumption and were not known to consumers at the time of consumption.

To be reflected in the CPI, rebates or credits must relate to specific products and apply to all consumers (or a large proportion of consumers) of the product affected. CPI practice has been to reflect the impact of rebates at the time when rebates are paid. If a rebate was greater than the average monthly charge, the remainder of the rebate was reflected in following months until the rebate had been fully accounted for. Thus the CPI could reflect an average price close to zero for one month or several months in some situations. As a result, the treatment

of rebates has had a significant effect on the rate of change in the CPI, making the indexes for utilities particularly volatile.

The impact of the change will be to reduce short-term fluctuations in the CPI arising from rebates on past consumption. By treating retroactive rebates as windfalls to income rather than as price changes, the level of the CPI will be higher for the months that would have been affected under the past treatment of these rebates, with a corresponding impact on annual averages.

Rebate programs known to consumers at the time of purchase will continue to be accounted for in the CPI.
