A Look Back: 2011–12 projects	24

Why a 5-year plan?

Government's commitment to repairing rural roads and keeping communities strong led to Nova Scotia's first five-year paving and highway improvement plan in November 2010.

The 2012–13 edition is the third five-year plan. It outlines major construction projects, repaving, major bridge replacements and maintenance, and infrastructure work the province plans to pursue on a year-by-year basis during the next five years. This advance planning allows the department to fix more roads, reach more communities and work more effectively with partners while being transparent and accountable.

The plan also enables Nova Scotians to track provincial road improvements on a yearly basis. Each year following budget approval, a detailed plan for that year's highway construction season will be released, along with a report on the previous year's projects.

The plan also explains government's new approach, making the most of every available dollar to address highway construction and maintenance. In the past, the majority of funding has gone to the most damaged roads, so the overall condition of roads deteriorated faster than they could be fixed.

The province is now taking a more balanced approach which uses a variety of improvement options, with a greater focus on improving paved roads before they become severely damaged and require more costly repairs. Some road improvement work is also being done in-house to ensure that prices are competitive in all parts of the province.

Building and maintaining roads and infrastructure creates

- thousands of jobs
- allows local businesses to transport goods to market
- connects Nova Scotians to vital services, employment, and education
- leads visitors to every corner of our province

Highway construction and maintenance: a look back

The last four provincial highway budgets have been record setting—totaling more than \$1 billion.

The department has paved more than 1,900 kilometres in the last three years with another 500 kilometres planned in 2012–13.

The total highway capital budget is \$281 million and a further \$82 million will be spent in 2012–13 from operational funding for highway maintenance improvements. That means \$363 million will be invested in Nova Scotia roads this construction season.

A project report on the 2011–12 provincial highway capital program is on page 24.

In the summer of 2011 the provincial government began chip sealing with one crew, to introduce competition to the industry, and to maximize taxpayers dollars in terms of highway resurfacing.

Prior to launching the in-house program, the province was paying \$91,000 per kilometre of double chip seal. In 2011, the province paid an average of \$40,000 per kilometre for tendered projects.

The in-house program delivered more services for taxpayers by allowing the work to be done for less money, and by affecting and reducing overall tender prices.

The outcome was the province saved more than \$2 million on tenders last season. Those savings meant the province could start certain capital projects a year earlier than listed in the 5-year plan. By paying less, Nova Scotia is paving more.

Roads in Nova Scotia

100 series highways

These are the highest traffic volume roads in Nova Scotia and many are part of the National Highway System

Secondary highways, trunks, and routesLower traffic volumes than 100-series highways, but well used to connect local communities

Provincial local roads

Local paved and gravel roads with much lower traffic volumes, sometimes less than 500 vehicles per day

Municipal roads

Roads within municipal boundaries that fall under the responsibility of local municipalities

Highway funding in Nova Scotia in 2012–13

There are three primary sources of funding for highway construction and maintenance in Nova Scotia.

Provincial

The majority of highway funding in Nova Scotia is from provincial sources. Provincial funding includes all revenue from provincial gas taxes and the net revenue from the Registry of Motor Vehicles.

Federal

The federal government provides funding from a variety of federal programs, including the Canada Strategic Infrastructure Fund, the Building Canada Plan, the Gateways and Border Crossings Fund and infrastructure stimulus funding.

Municipal

Some funding is received from municipalities for cost-shared projects in their jurisdictions.

Capital funding	breakdown
Provincial	\$240,756,633
Federal	\$32,743,367
Municipal	\$1,500,000

Each year the highway capital budget is approved as part of the provincial budget. This funding is used for projects across the province, with more than 150 highway improvement projects slated for 2012–13.

The 2012–13 highway capital budget is \$281 million, one of the largest investments ever made in Nova Scotia's road system.

The following chart provides a breakdown of how this funding is being spent.

Capital funding summary

Major construction (new highways and bridges)	\$110,000,000
Asphalt	\$106,000,000
Bridge replacement/rehabilitat	ion \$40,000,000
Land purchase	\$7,500,000
Equipment, machinery and ferr	ies \$9,500,000
Highway designs, survey, studie	es \$2,000,000
Other provincial projects	\$6,000,000
Total	\$281,000,000

Making our dollars go further

To get the best value for our investment, we are taking a more balanced approach, a principle of the department's highway improvement planning.

While we continue to address the most severely damaged roads on a "worst first" basis, a larger portion of the highway improvement budget is being directed toward improving paved roads before they become severely damaged and need more costly repairs. Although we continue to face significant road improvement needs, this approach will ensure that funding is used in a more efficient and effective way.

This more balanced approach, using the latest treatment options and preservation techniques, will provide several benefits, including:

- improving more roads in more communities
- providing a hard surface for more gravel roads
- paving smarter by preventing more costly problems before they happen
- improving more low-volume paved roads

Pavement preservation

Pavement preservation involves extending the useful life of asphalt to improve smoothness, reduce potholes and decrease rutting and cracking. This keeps the roads smoother and safer at a much lower cost than allowing them to deteriorate to the point of needing full reconstruction. There are various methods of pavement preservation, including:

Crack sealing: a rubberized asphalt seal compound to prevent water from weakening the paved surface of the road base

Chip sealing: an asphalt mixture and stone chips applied to protect and seal pavement exhibiting distress

Micro sealing: a thin asphalt mixture applied to existing pavement showing signs of premature surface distress to protect the pavement and repair ruts

Single lift overlay: a single layer of asphalt pavement to correct minor-to-moderate surface distress in an otherwise good quality pavement

Surface stabilization

Local, low-volume roads

Surface stabilization involves using a variety of treatments to improve local road conditions, resulting in smoother, dust-free road surfaces for drivers.

Mobile Asphalt Plant

Government has committed to increase resurfacing of secondary (non-100 series) roads by 50 per cent. To help achieve that goal the Department of Transportation and Infrastructure Renewal will set up a mobile asphalt plant this summer within the existing budget.

There will be savings for taxpayers, as this publiclyowned venture will ensure competitive prices and allow the province to pave more roads in all areas.

Surface stabilization options

Black gravel: a mixture of recycled asphalt and gravel that provides additional strength, improves driving surface and emits very little dust

Double chip seal paving on gravel: aggregate mixed with tar applied directly to gravel that provides a smoother surface, reduced potholes and a dust-free surface

Double chip seal paving on recycled asphalt: pulverizing existing severely
deteriorated pavement followed by chip
seal over gravel that strengthens and
smooths the surface, reduces potholes and
provides a dust-free surface

Asphalt concrete paving: applying a single layer of asphalt, improving drainage culverts and ditches and strengthening and smoothing the surface

How are projects prioritized?

100 series highways

Major construction upgrades and twinning of our 100 series highways are based primarily on traffic volumes, safety studies, and collision statistics.

For paving projects, the department has implemented a Pavement Management System in 2010. It involves collecting up-to-date pavement conditions and traffic information on all 100 series highways and uses a software program to generate the best possible maintenance and rehabilitation plan based on nationally accepted guidelines. This information, combined with the technical knowledge of highway program staff, is used to develop annual and multi-year paving plans, including various rehabilitation and preservation projects.

Trunks, routes and local paved roads handling more than 500 vehicles daily

The following factors are used to assess priorities for repaying secondary and local paved roads

- traffic volumes
- surface roughness
- pavement conditions (cracking, rutting, and broken pavement)

Priorities for pavement preservation projects, such as crack and chip sealing, are developed by highway program staff who assess the current age and condition of the pavement.

Local low-volume paved roads and gravel roads

The following factors help determine priorities for surface stabilization projects

- traffic volumes
- roadside development, including the number of homes, businesses, and community sites (eg., churches, community halls, recreation centres, parks, etc.) located on the road
- requests for road repairs from residents, businesses, not for profit groups, community groups, chambers of commerce and elected officials

Bridges

Provincial bridges are inspected and assessed on an annual basis by Department of Transportation and Infrastructure Renewal engineers and inspectors. Priorities for annual and multi-year bridge rehabilitation and replacement programs are developed by staff considering the condition, age, and use of the structure, the volume of traffic and weights, and the class of roadway where the structure is located. In all cases, public safety is the primary consideration.

Road building in Nova Scotia

Road building is an important industry in Nova Scotia, creating good jobs and injecting millions of dollars into the economy. An estimated 5,000 Nova Scotians are directly employed in road building, and another 2,500 are indirectly employed by the industry. The annual payroll of Nova Scotians employed in road building across the province is approximately \$300 million. Each road construction or maintenance project also brings spinoff benefits for support industries, including construction materials, metalwork/welding, engineering, electrical, and hazard removal.

Building and maintaining our roads

Our roads are a significant taxpayer investment.

New construction

Twinning one kilometre of highway: approximately \$3 million

Building a new two-lane highway: approximately \$3.5 million, while a kilometre of new four-lane highway costs approximately \$6 million

Reconstruction, rehabilitation, repaving

Upgrading a trunk highway: \$500,000 to \$1 million per kilometre

Rehabilitation and repaving a two-lane highway: approximately \$300,000 to \$350,000 per kilometre

Pavement preservation: approximately \$20,000 to \$200,000 per kilometre depending on the treatment

5-year highway improvement projects

The following table lists major construction and asphalt paving projects on 100-series highways, trunks and routes, plus major bridge replacements and rehabilitations for the next five years.

Major construction projects approved for 2012–13

Local roads repaving, pavement preservation and low volume stabilization projects are developed and approved on an annual basis.

County Type
