## I. Introduction

---

This report presents population projections for Ontario and each of its 49 census divisions, by age and gender, from the base year of 2017 to 2041. These projections are produced by the Ontario Ministry of Finance and are an update to the projections released in June 2017.

The Ministry of Finance produces an updated set of population projections every year to provide a demographic outlook reflecting the most up-to-date trends and historical data. This update uses as a base the new 2017 population estimates from Statistics Canada (based on the 2011 Census) and includes minor changes to reflect the most recent trends in fertility, mortality and migration.

The new projections include three scenarios for Ontario. The medium, or reference scenario, is considered most likely to occur if recent trends continue. The low- and high-growth scenarios provide a reasonable forecast range based on plausible changes in the components of growth. Projections for each of the 49 census divisions are for the reference scenario only.

The projections do not represent Ontario government policy targets or desired population outcomes, nor do they incorporate explicit economic or planning assumptions. They are developed using a standard demographic methodology in which assumptions for population growth reflect recent trends in all streams of migration and the continuing evolution of long-term fertility and mortality patterns in each census division. Census division projections are summed to obtain the Ontario total.

The report includes a set of detailed statistical tables on the new projections. Key demographic terms are defined in a glossary.

## II. Highlights

---

Highlights of the new 2017–2041 projections reference scenario:

- Ontario’s population is projected to grow by 30.2 per cent, or almost 4.3 million, over the next 24 years, from an estimated 14.2 million on July 1, 2017 to almost 18.5 million by July 1, 2041.
- The annual rate of growth of Ontario’s population is projected to ease gradually from 1.8 per cent to 0.9 per cent over the projection period.
- Net migration is projected to account for 76 per cent of all population growth in the province over the 2017–2041 period, with natural increase accounting for the remaining 24 per cent. In the second half of the projections, the contribution of natural increase moderates as baby boomers increasingly reach senior years and the number of deaths increases more rapidly.
- The number of seniors aged 65 and over is projected to almost double from 2.4 million, or 16.7 per cent of population, in 2017 to 4.6 million, or 24.8 per cent, by 2041. The growth in the share and number of seniors accelerates over the 2017–2031 period as baby boomers turn age 65. After 2031, the growth in the number of seniors slows significantly.
- The number of children aged 0–14 is projected to increase gradually over the projection period, from 2.2 million in 2017 to 2.7 million by 2041. The children’s share of population is projected to decrease gradually from 15.7 per cent in 2017 to 14.8 per cent by 2041.
- The number of Ontarians aged 15–64 is projected to increase from 9.6 million in 2017 to 11.2 million by 2041. This age group is projected to decline as a share of total population, from 67.6 per cent in 2017 to 60.4 per cent by 2041. As baby boomers continue to turn age 65, the growth in population aged 15–64 slows until 2027–28 and then accelerates over the remainder of the projection.
- The Greater Toronto Area (GTA) is projected to be the fastest growing region of the province, with its population increasing by 2.8 million, or 40.8 per cent, to reach almost 9.7 million by 2041. The GTA’s share of provincial population is projected to rise from 48.3 per cent in 2017 to 52.3 per cent in 2041.
- All regions see a shift to an older age structure. The GTA is expected to remain the region with the youngest age structure as a result of strong international migration and positive natural increase.

### III. Projection Results

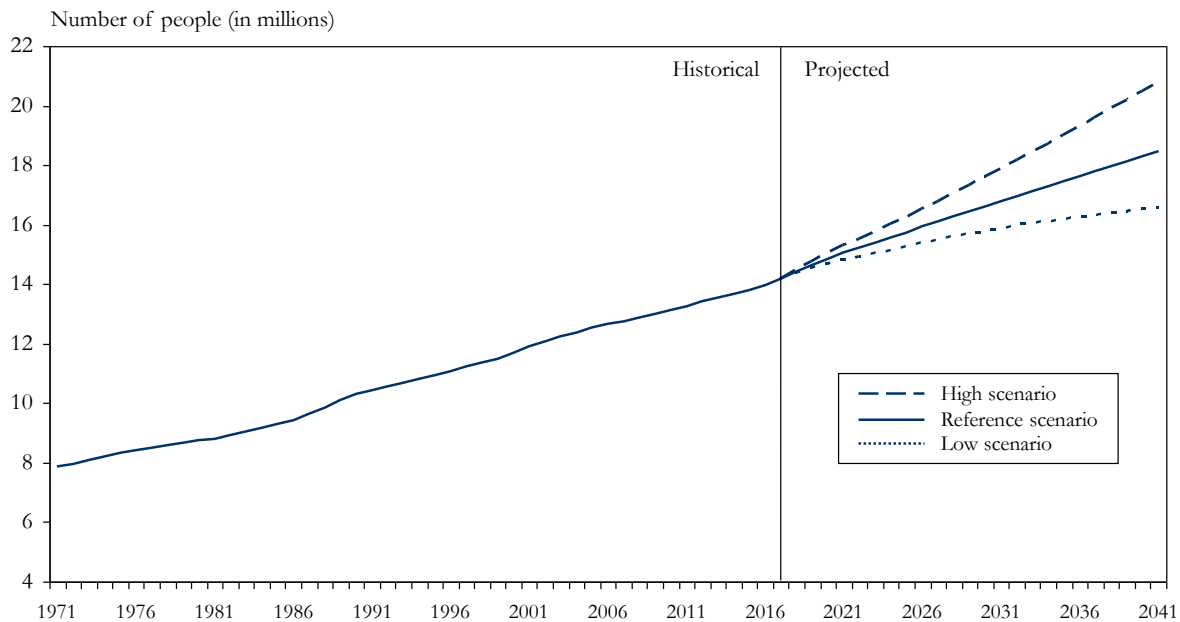

#### Reference, low and high-growth scenarios

The Ministry of Finance projections provide three growth scenarios for the population of Ontario to 2041. The medium-growth or reference scenario is considered most likely to occur if recent trends continue. The low- and high-growth scenarios provide a forecast range based on plausible changes in the components of growth. Population is projected for each of the 49 census divisions for the reference scenario only. Charts and tables in this report are for the reference scenario, unless otherwise stated.

Under all three scenarios, Ontario's population is projected to experience growth over the 2017–2041 period. In the reference scenario, population is projected to grow 30.2 per cent, or almost 4.3 million, over the next 24 years, from an estimated 14.2 million on July 1, 2017 to almost 18.5 million on July 1, 2041.

In the low-growth scenario, population increases 16.7 per cent, or 2.4 million, to reach almost 16.6 million people by 2041. In the high-growth scenario, population grows 46.6 per cent, or 6.6 million, to 20.8 million people by the end of the projection period.

Chart 1  
Ontario population, 1971 to 2041

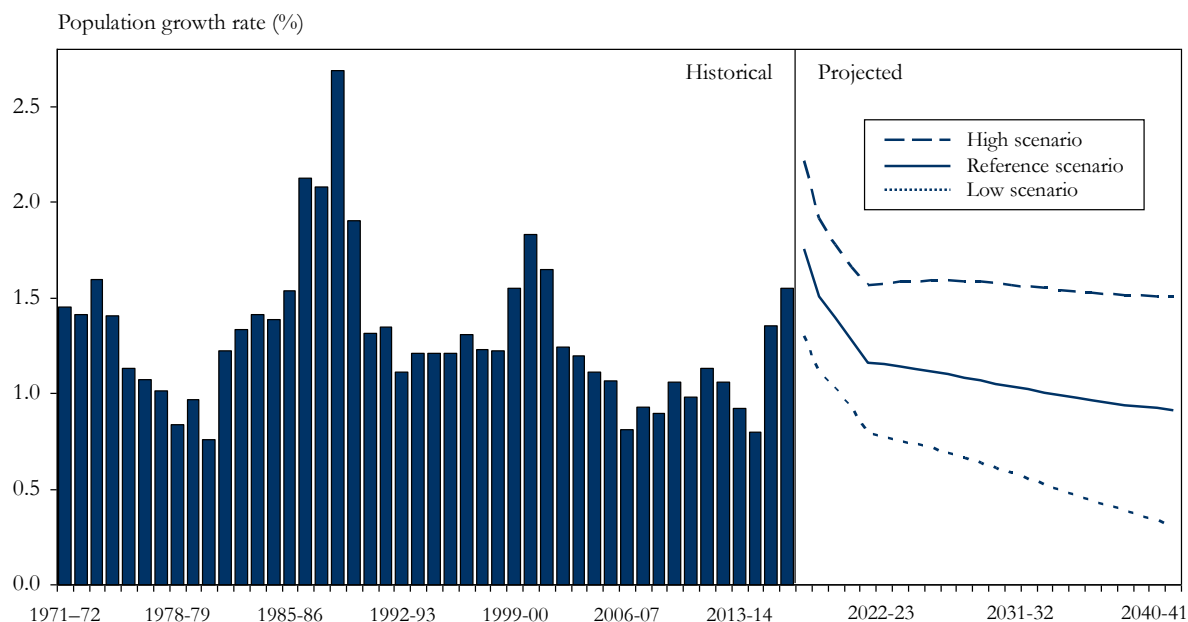

Sources: Statistics Canada, 1971–2017 and Ontario Ministry of Finance projections.

The annual rate of growth of Ontario's population in the reference scenario is projected to ease gradually from 1.8 per cent to 0.9 per cent over the projection period.

In the low-growth scenario, the annual rate of population growth is projected to decline from 1.3 per cent to 0.3 per cent over the projection period. In the high-growth scenario, the annual

population growth rate is projected to decrease gradually from 2.2 per cent to 1.5 per cent between 2017 and 2041.

Chart 2  
Annual rate of population growth in Ontario, 1971 to 2041

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

## The components of Ontario population change

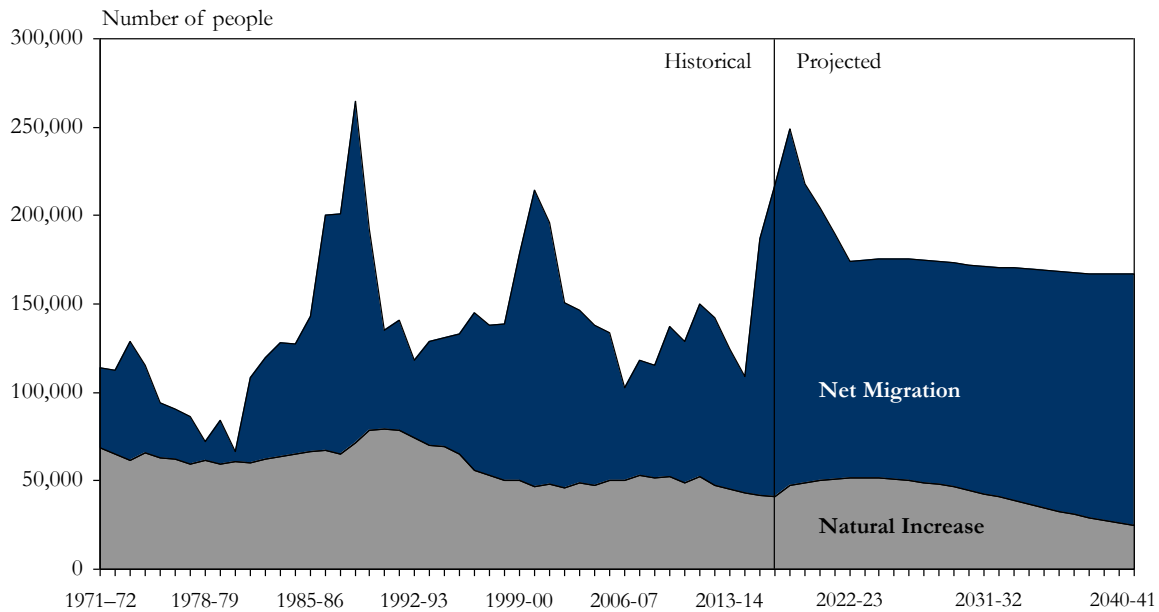

In any given year, the contributions of natural increase and net migration to population growth vary. While natural increase trends evolve slowly, net migration can be more volatile, mostly due to swings in interprovincial migration and variations in international migration. For example, over the past 10 years, the share of population growth coming from net migration has been as high as 81 per cent in 2016–17 and as low as 55 per cent in 2008–09.

Net migration levels to Ontario have averaged about 95,000 per year in the past decade, with a low of 63,000 in 2008–09 and a high of 176,000 in 2016–17. The numbers of births and deaths have been rising slowly, while natural increase has declined from 53,000 to 41,000 over the last decade.

Net migration is projected to be relatively high at the beginning of the projections as net gains of population through interprovincial migration continue and the number of non-permanent residents keeps increasing at a rapid pace. Ontario’s annual net migration gain is projected to decrease initially from 202,000 in 2017–18 to 123,000 in 2021–22 as it returns to more normal values, and to subsequently increase over the rest of the projection period to reach 142,000 by 2040–41. The share of population growth accounted for by net migration is projected to decline from 81 per cent in 2017–18, to 70 per cent in 2021–22, and then to gradually rise to reach 85 per cent by 2041 as a result of lower natural increase.

Chart 3

**Contribution of natural increase & net migration to Ontario's population growth, 1971 to 2041**

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

Future levels of natural increase will be affected by two main factors over the projection period. First is the passage of the baby boom echo generation (children of baby boomers) through peak fertility years, which results in an increase in the number of births through the late 2010s and early 2020s. Births are projected to increase from 147,000 in 2017–18 to over 162,000 by the mid-2020s and remain above that level until the end of the projection period.

The second major factor influencing the future path of natural increase in Ontario is the continuing transition of large cohorts of baby boomers into the senior age group. By 2031, all baby boomers will be 65 or older and the number of deaths will start to increase more rapidly. Over the first decade of the projections, the pace of increase in the annual number of deaths in Ontario is projected to slow as the small cohorts born during the 1930s reach their life expectancy. From 2017 to 2025, the annual number of deaths is projected to rise from 100,000 to 111,000. Over the remaining years to 2041, the annual number of deaths increases faster, to reach 153,000.

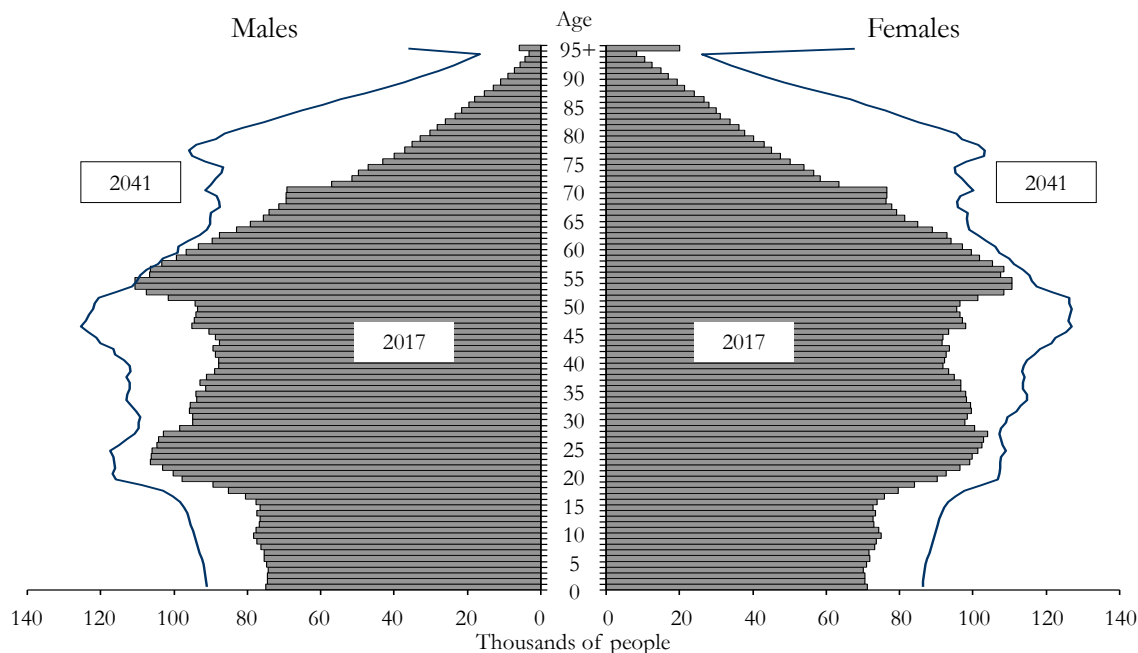

Initially driven by birth rising faster than deaths, natural increase is projected to rise from 47,000 in 2017–18 to peak at almost 52,000 in 2022–23, followed by a steady decline to 25,000 by 2040–41. The share of population growth accounted for by natural increase is projected to decline from 29 per cent in 2022–23 to 15 per cent by 2040–41.

## Age structure

By 2041, there will be more people in every age group in Ontario compared to 2017, with a sharp increase in the number of seniors. Baby boomers will have swelled the ranks of seniors; children of the baby boom echo generation will be of school-age; and the baby boom echo cohorts, along with a new generation of immigrants, will have bolstered the population aged 15–64.

Chart 4

### Age pyramid of Ontario's population, 2017 and 2041

Sources: Statistics Canada, 2017, and Ontario Ministry of Finance projections.

The median age of Ontario's population is projected to rise from 41 years in 2017 to 44 years in 2041. The median age for women climbs from 42 to 45 years over the projection period while for men it is projected to increase from 40 to 43 years.

The number of seniors aged 65 and over is projected to almost double from about 2.4 million, or 16.7 per cent of population in 2017, to almost 4.6 million, or 24.8 per cent, by 2041. In 2015, for the first time, seniors accounted for a larger share of population than children aged 0–14.

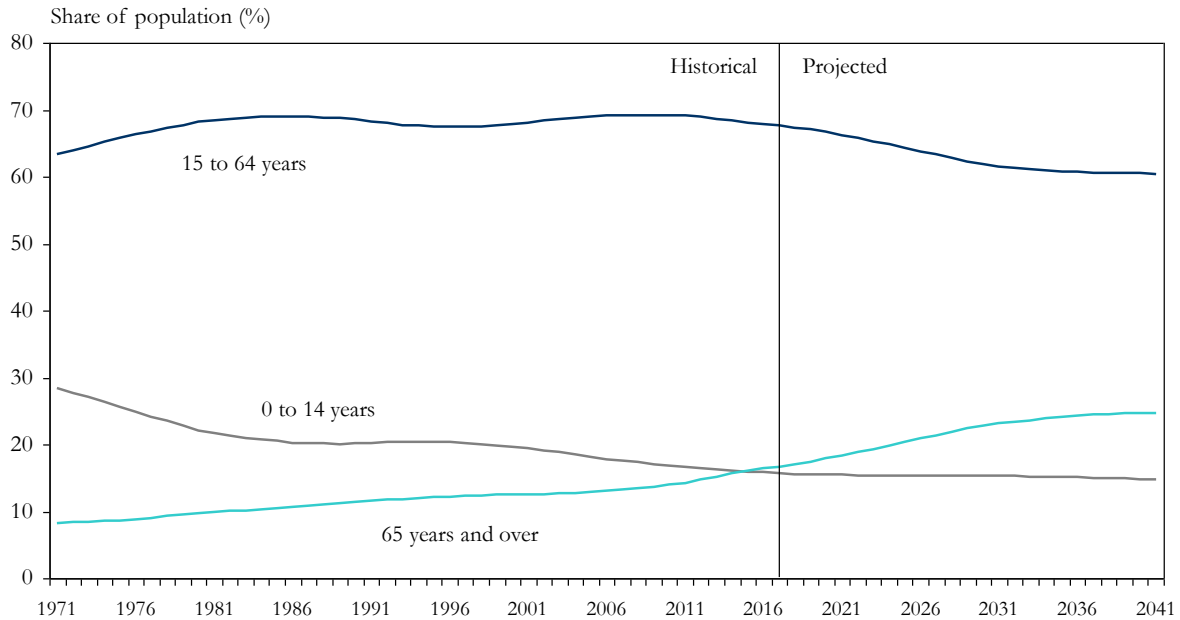

By the early 2030s, once all baby boomers have reached age 65, the pace of increase in the number and share of seniors is projected to slow significantly. The annual growth rate of the senior age group is projected to slow from an average of 3.6 per cent over 2017–31 to 1.2 per cent by the end of the projection period. However, this age group will still be growing much faster than the 0–14 and 15–64 age groups.

The older age groups will experience the fastest growth among seniors. The number of people aged 75 and over is projected to rise from 1.0 million in 2017 to 2.7 million by 2041. The 90+ group will more than triple in size, from 120,000 to 400,000.

The proportion of women among the oldest seniors is projected to remain higher than that of men but declines slightly as male life expectancy is projected to increase relatively faster. In 2017, there were 39 per cent more women than men in the 75+ age group. By 2041, it is projected that there will be 19 per cent more women than men in the 75+ age group.

Chart 5

**Proportion of population aged 0–14, 15–64 and 65+ in Ontario, 1971 to 2041**

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

The number of children aged 0–14 is projected to increase gradually over the projection period, from 2.2 million in 2017 to almost 2.7 million by 2041. The share of children in the population is projected to decrease from 15.7 per cent in 2017 to 14.8 per cent by 2041. By the late 2030s, the number of children is projected to grow at a much slower pace than other age groups, reflecting the smaller number of women in their 20s and 30s.

The number of Ontarians aged 15–64 is projected to grow from 9.6 million in 2017 to 11.2 million by 2041, a slower pace of increase than the 0–14 and 65+ age groups. As a result, the 15–64 age group is projected to account for a decreasing share of total population, declining from 67.6 per cent in 2017 to 60.4 per cent by 2041.

The growth rate of the population aged 15–64 is projected to continue to trend lower until the mid-2020s. From an annual rate of growth of 1.4 per cent at the beginning of the projection, this age group is projected to grow by less than 0.3 per cent by 2027–28. Thereafter, as the children of the baby boom echo begin to reach age 15, the pace of annual growth of the 15–64 age group is projected to improve, reaching 0.9 per cent in 2040–41.

Chart 6

**Pace of growth of population age groups 0–14, 15–64 and 65+ in Ontario, 1971 to 2041**

Sources: Statistics Canada, 1971–2017 and Ontario Ministry of Finance projections.

Within the 15–64 age group, the number of youth (those aged 15–24) is initially projected to decline slightly, from a high of 1,856,000 in 2018 to a low of 1,834,000 by 2022. The youth population is then projected to resume growing, reaching over 2.1 million by 2041. The youth share of total population is projected to decline from 13.0 per cent in 2017 to 11.4 per cent by 2035, followed by a small rise to 11.6 per cent by 2041.

The number of people aged 25–44 is projected to increase during the projection period, from 3.8 million in 2017 to 4.5 million by 2041, while their share of population is projected to initially increase from 26.9 to 27.7 per cent by 2023, followed by a decline to 24.5 per cent by 2041.

The number of people aged 45–64 is projected to continue to increase at the beginning of the projection period, from 3.9 million in 2017 to almost 4 million by 2021 before declining slightly during the 2020s. This age group resumes growth during the 2030s to reach almost 4.5 million by 2041. Its share of population is projected to initially decline from 27.7 to 23.4 per cent by 2033, and to resume growing to reach 24.3 per cent by 2041.

## Regional components of population change

The main demographic determinants of regional population growth are the current age structure of the population, the pace of natural increase, and the migratory movements in and out of each of Ontario’s regions. Demographic trends vary significantly among the 49 census divisions that comprise the six geographical regions of Ontario.

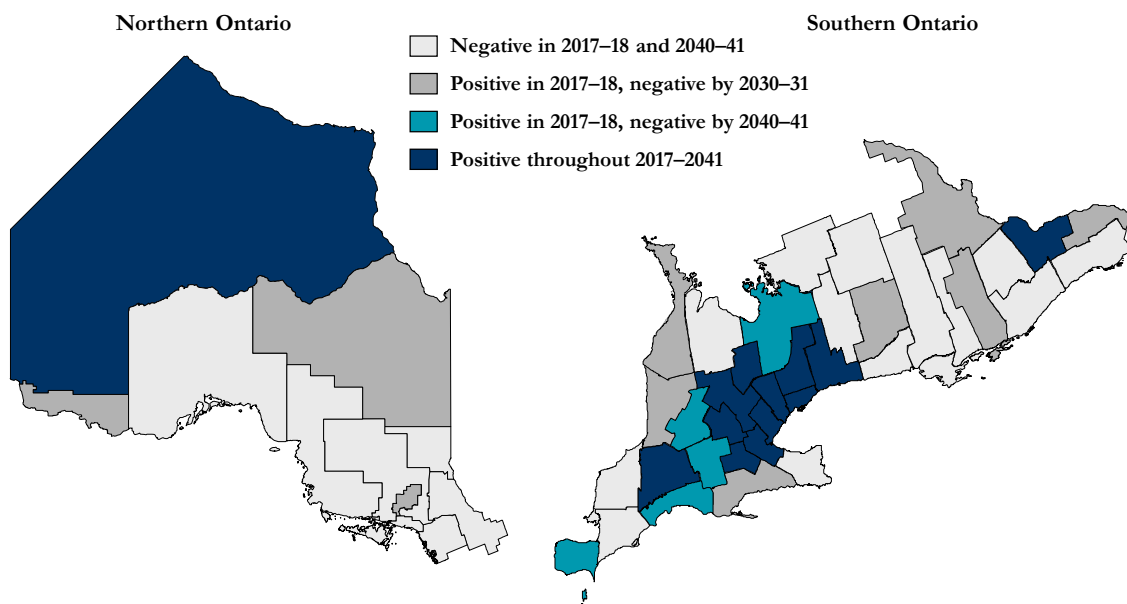

The current age structure of each region has a direct impact on projected regional births and deaths. A region with a higher share of its current population in older age groups will likely experience more deaths in the future than a region of comparable size with a younger population. Similarly, a region with a large share of young adults in its population is expected to see more births than a region of comparable size with an older age structure. Also, since migration rates vary by age, the age structure of a region or census division will have an impact on the migration of its population.

The general aging of the population will result in a rising number of census divisions where deaths will exceed births (negative natural increase) over the projection period. Deaths exceeded births in 24 of Ontario’s 49 census divisions over the past five years. This number is projected to rise gradually so that 36 census divisions are projected to experience negative natural increase by 2040–41. These 36 census divisions will represent 26 per cent of Ontario’s population in 2041.

This declining trend in natural increase means that many census divisions in Ontario where natural increase previously was the main or even sole contributor to population growth have already started to see their population growth slow. This trend is projected to continue as the population ages further.

Chart 7

**Evolution of natural increase by census division, 2017 to 2041**

Source: Ontario Ministry of Finance projections.

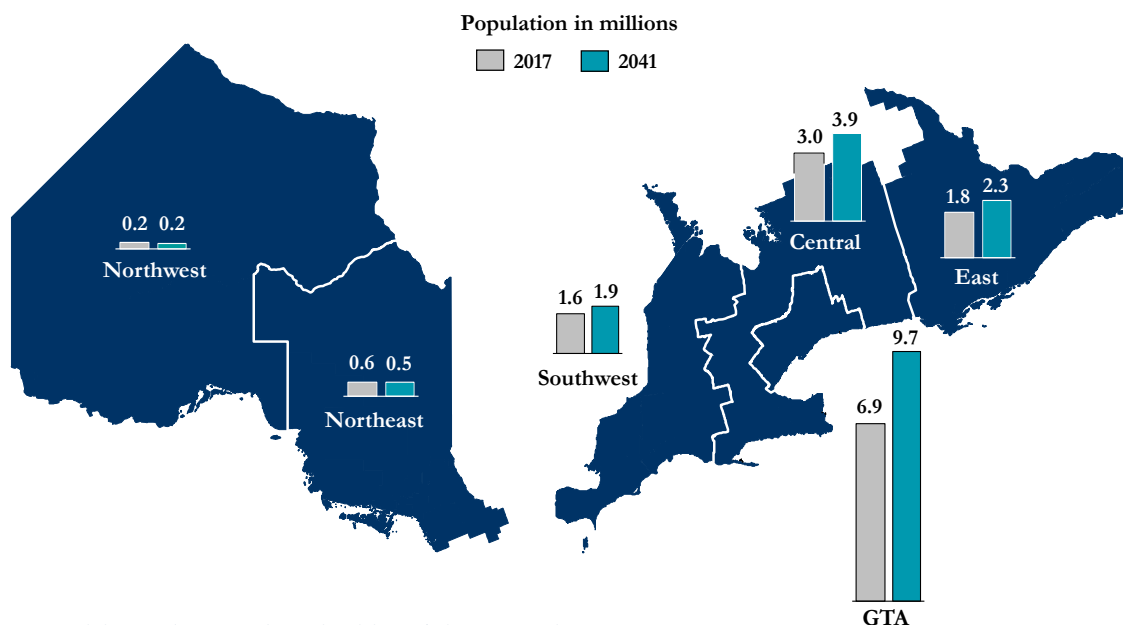

Migration is the most important factor contributing to population growth for Ontario as a whole and for most regions. Net migration gains, whether from international sources, other parts of Canada or other regions of Ontario, are projected to continue to be the major source of population growth for almost all census divisions.

Large urban areas, especially the Greater Toronto Area (GTA), which receive most of the international migration to Ontario, are projected to grow strongly. For other regions such as Central Ontario, the continuation of migration gains from other parts of the province will be a key source of growth. Some census divisions of Northern Ontario receive only a small share of international migration and have been experiencing net out-migration, mostly among young adults, which reduces both current and future population growth.

## Regional population growth

The GTA is projected to be the fastest growing region of the province, accounting for over 65 per cent of Ontario’s net population growth to 2041. The GTA’s population is projected to increase from 6.9 million in 2017 to 9.7 million in 2041. The region’s share of total Ontario population is projected to rise from 48.3 per cent in 2017 to 52.3 per cent in 2041, passing the 50 per cent mark in 2026.

Chart 8  
Population of Ontario regions, 2017 and 2041

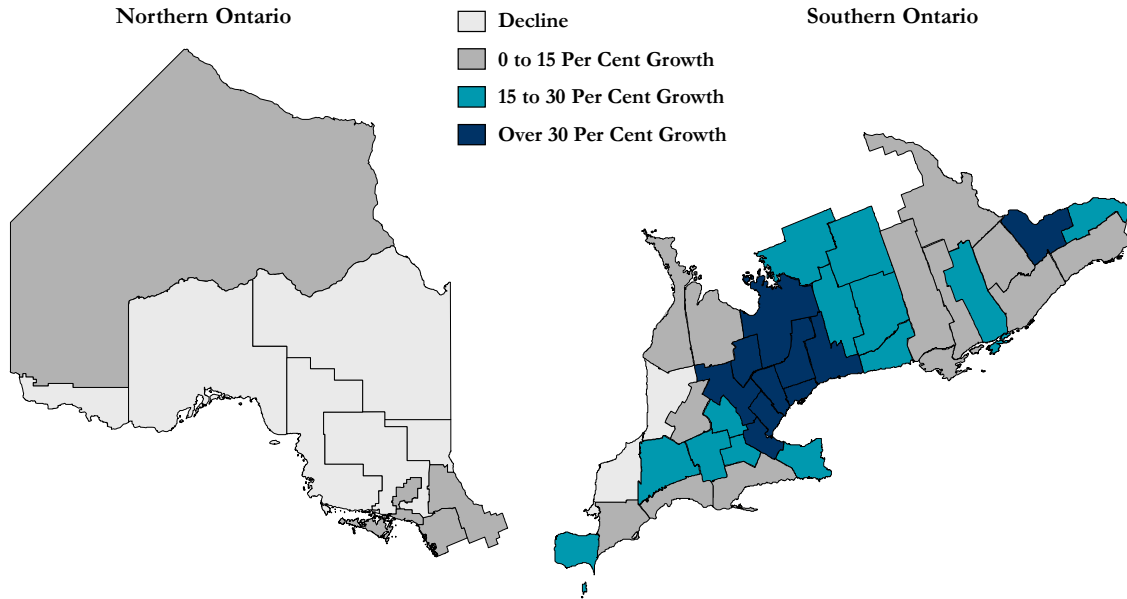

Sources: Statistics Canada, 2017, and Ontario Ministry of Finance projections.

Within the GTA, Toronto’s population is projected to rise from 2.93 million in 2017 to 3.91 million in 2041, an increase of 33.5 per cent, slightly faster than the provincial growth rate. Growth in the other census divisions of the GTA (Durham, Halton, Peel and York) is projected to be significantly faster than the Ontario average, with the addition of over 1.8 million people to the suburban GTA.

Peel is projected to see its population increase by 717,000 over 2017–41, a 47.8 per cent rise. Halton is projected to be the fastest-growing census division in Ontario over the projection period, with growth of 56.2 per cent to 2041.

Chart 9

**Population growth/decline by census division over 2017 to 2041**

Source: Ontario Ministry of Finance projections.

The population of Central Ontario is projected to grow by 823,000 or 27.0 per cent, from 3.04 million in 2017 to 3.87 million in 2041. The region’s share of provincial population is projected to decline slightly from 21.4 to 20.9 per cent. Two census divisions located north of the GTA are projected to continue to experience population growth significantly above the provincial average: Simcoe at 37.6 per cent and Dufferin at 43.3 per cent.

The population of Eastern Ontario is projected to grow 22.7 per cent over the projection period, from 1.85 million to 2.27 million. Ottawa is projected to grow fastest (34.1 per cent) from 995,000 in 2017 to 1.33 million in 2041. Most other Eastern Ontario census divisions are also projected to grow, but below the provincial average, with Frontenac and Prescott & Russell growing by 17.9 and 13.8 per cent respectively.

The population of Southwestern Ontario is projected to grow from 1.64 million in 2017 to 1.90 million in 2041, an increase of 15.8 per cent. Growth rates within Southwestern Ontario vary, with Middlesex and Oxford growing fastest (27.2 and 17.5 per cent respectively). The populations of Lambton and Huron are projected to continue declining slightly over the 2017–2041 period.

The population of Northern Ontario is projected to be relatively stable over the projection horizon, with a slight decrease of 2.1 per cent, from 797,000 in 2017 to 780,000 by 2041. Within the North, the Northeast is projected to see a population decline of 17,000 or 3.0 per cent, from 558,000 to 541,000. The Northwest is projected to experience slight population growth of a few hundred people, or 0.2 per cent, from 239,000 to 240,000.

In the past, Northern Ontario's positive natural increase offset part of the losses it experienced through net migration. However, natural increase in the North as a whole is currently negative.

Table A

**Population Shares of Ontario Regions, 1991 to 2041**

Share of Ontario Population (%)	1991	2001	2011	2021	2031	2041
GTA	42.0	44.5	47.2	49.2	50.8	52.3
Central	22.2	22.1	21.6	21.3	21.1	20.9
East	13.9	13.5	13.2	12.9	12.6	12.3
Southwest	13.7	13.0	12.0	11.3	10.8	10.3
Northeast	5.8	4.8	4.3	3.7	3.3	2.9
Northwest	2.4	2.1	1.8	1.6	1.4	1.3

Sources: Statistics Canada, 1991–2011, and Ontario Ministry of Finance projections.

**Regional age structure**

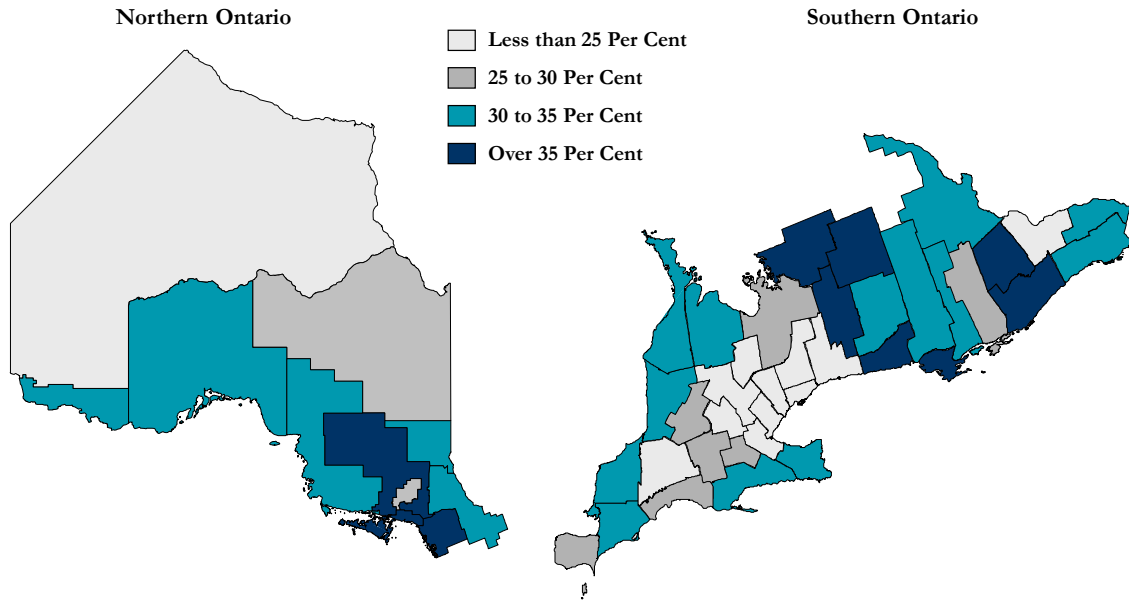

All regions are projected to see a continuing shift to an older age structure. The largest shifts in age structure are projected to take place in census divisions, many in northern and rural areas, where natural increase and net migration are projected to become or remain negative. The GTA is expected to remain the region with the youngest age structure, a result of strong international migration and positive natural increase. The Northeast is projected to remain the region with the oldest age structure.

In 2017, the share of seniors aged 65 and over in regional population ranged from a low of 14.7 per cent in the GTA to a high of 20.9 per cent in the Northeast. Among census divisions, it ranged from 13.0 per cent in Peel to 32.4 per cent in Haliburton.

By 2041, the share of seniors in regions is projected to range from 22.0 per cent in the GTA to 31.1 per cent in the Northeast. Among census divisions, it is projected to range from 20.5 per cent in Kenora to 44.5 per cent in Haliburton.

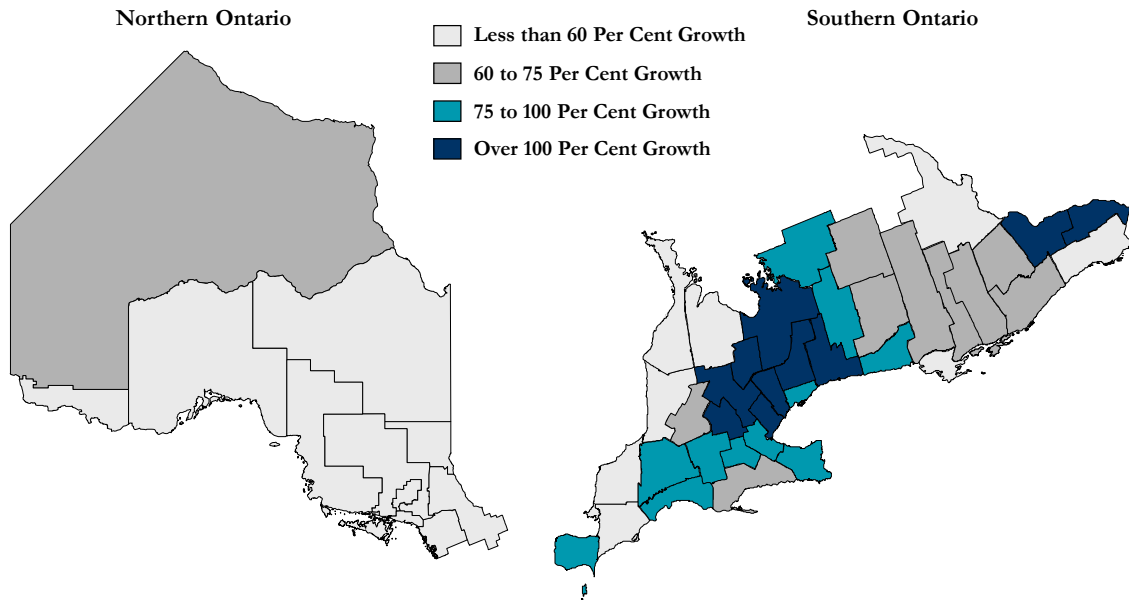

Chart 10  
Share of seniors in population by census division in 2041

Source: Ontario Ministry of Finance projections.

Even as the share of seniors in census divisions located in and around the suburban GTA is projected to remain lower than the provincial average, the increase in the number of seniors in this area will be the most significant.

Chart 11  
Growth in number of seniors by census division, 2017 to 2041

Source: Ontario Ministry of Finance projections.

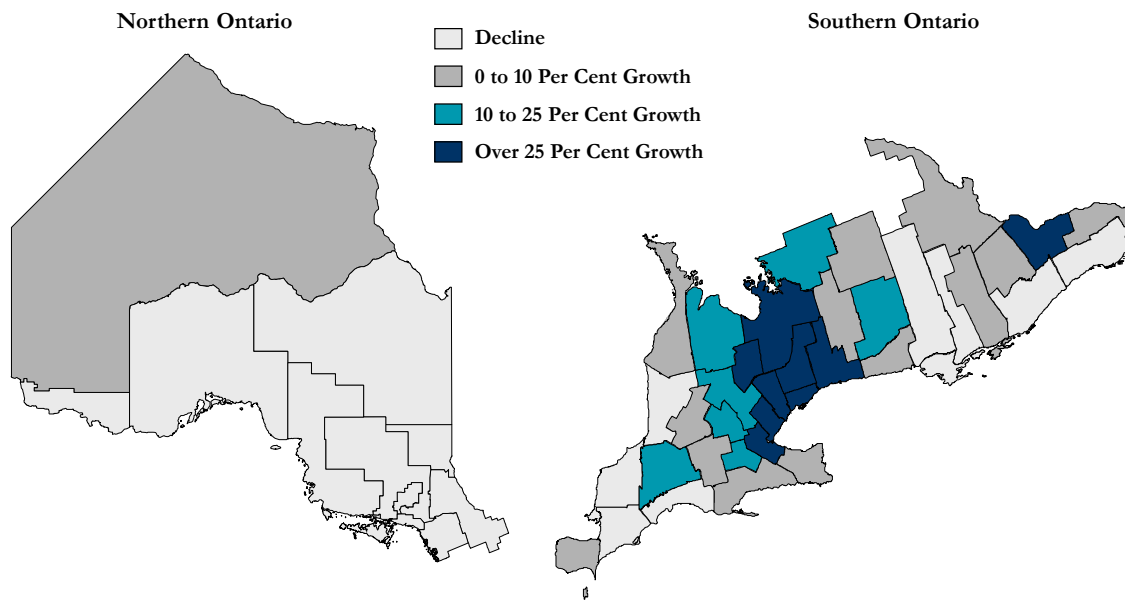

The number of seniors is projected grow by about 133 per cent in the suburban GTA. Conversely, the number of seniors grows most slowly (less than 40 per cent) in Algoma, Sudbury, Rainy River and Timiskaming.

The number of children aged 0–14 is projected to decline in the North, but to increase in the rest of Ontario over the projection period. However, by 2041 the share of children in every region is projected to be slightly lower than it is today. In 2017, the highest share of children among regions was in the Northwest at 16.9 per cent; the Northeast had the lowest share at 14.6 per cent. By 2041, the Northeast is projected to remain the region with the lowest share of children at 13.5 per cent while the highest share is projected to be found in the Northwest at 15.8 per cent.

The GTA census divisions, along with Dufferin, Simcoe, Hamilton and Ottawa, are projected to record the highest growth in the number of children aged 0–14 over the 2017–2041 period, with Halton seeing the most growth at 44 per cent. Conversely, the majority of rural and northern census divisions are projected to have significantly fewer children by 2041, with the largest declines in the North. However, most census divisions are projected to see only a slight decrease in the share of children in their population. In 2017, the highest share of children was found in Kenora at 22.1 per cent and the lowest share in Haliburton at 9.5 per cent. By 2041, Kenora is projected to still have the highest share of children at 20.6 per cent while Haliburton is projected to continue to have the lowest at 8.4 per cent.

Chart 12

**Growth/decline in number of children aged 0–14 by census division, 2017 to 2041**

Source: Ontario Ministry of Finance projections.

The share of population aged 15–64, which ranged from 64.5 per cent in the Northeast to 69.5 per cent in the GTA in 2017, is projected to decline over the 2017–2041 period in every region. The share of this age group is projected to range from 62.9 per cent of population in the GTA to 55.3 per cent in the Northeast by 2041.

While the share of population aged 15–64 is projected to fall in every census division of the province, the number of people in this age group is projected to increase in 20 of the 49 census divisions, mainly in the GTA, Central Ontario and urban areas of the East and the Southwest. The highest share of people aged 15–64 in 2017 was in Toronto (70.7 per cent) while the lowest was in Haliburton (58.1 per cent). By 2041, the highest shares are projected to be found Peel, Hamilton, Waterloo and Ottawa, with Toronto the highest (65.4 per cent). Prince Edward, Manitoulin, Haliburton, Northumberland, Kawartha Lakes and Parry Sound are projected have shares of people aged 15–64 below 50 per cent by the end of the projection period.

## IV. Methodology and Assumptions

---

### Projections methodology

The methodology used in Ministry of Finance long-term population projections is the cohort-component method, essentially a demographic accounting system. The calculation starts with the base-year population (2017) distributed by age and sex.

A separate analysis and projection of each component of population growth is made for each year, starting with births. Then, projections of deaths and the five migration components (immigration, net emigration, net change in non-permanent residents, interprovincial in- and out-migration, and intraprovincial in- and out-migration) are also generated and added to the population cohorts to obtain the population of the subsequent year, by age and sex.

This methodology is followed for each of the 49 census divisions. The Ontario-level population is obtained by summing the projected census division populations.

It should be noted that the population projections are demographic, founded on assumptions about births, deaths and migration over the projection period. Assumptions are based on the analysis of the long-term and the most recent trends of these components, as well as expectations of future direction. For Ontario, the degree of uncertainty inherent in projections is represented by the range between the low- and high-growth scenarios, with the reference scenario representing the most likely outcome.

### Base population

This report includes demographic projections released by the Ministry of Finance that use population estimates based on the 2011 Census adjusted for net undercoverage. Specifically, the projections use Statistics Canada's preliminary July 1, 2017 postcensal population estimates as a base.

As well as providing a new starting point for total population by age and sex, updating the projections to a new base alters the projected age structure and population growth in each census division. It also has an impact on many components of population growth that are projected by using age-specific rates, such as births, deaths and several of the migration streams.

### Fertility

The projected number of births for any given year is obtained by applying age-specific fertility rates to cohorts of women in the reproductive age group, ages 15 to 49. The projection model relies on four parameters<sup>1</sup> to generate the annual number of births. The first of these parameters, the total fertility rate (TFR), reflects the level of fertility while the other three parameters (the mean age at maternity, the skewness and the variance of the distribution) reflect the timing, or age, at which

---

<sup>1</sup> Based on the Pearsonian approach. See Glossary.

women have their babies. All parameters used are calibrated to generate age-specific fertility rates that closely follow recent trends.

Assumptions are based on a careful analysis of past age-specific fertility trends in Ontario and a review of fertility trends elsewhere in Canada and in other countries. A general and common trend is that a growing proportion of women are postponing births to their 30s and early 40s.

The decline in the fertility rate among young women is accompanied by a rise in fertility rates among older women. Over the past 20 years, teenagers and women in their early 20s have experienced the sharpest declines in fertility rates.

Fertility rates of women in their 30s and older, which were rising moderately over the 1990s and more rapidly over most of the 2000s, have shown a slower pace of increase in the most recent years. These are the same cohorts of women who postponed births during their 20s and are now having children in their 30s and early 40s.

Ontario's total fertility rate (TFR), which stood at 3.8 children per woman around 1960, fell below the replacement level of 2.1 children per woman in 1972. Over the rest of the 1970s, the TFR fell rapidly toward the 1.50–1.65 range where it has been hovering ever since. The latest data available (2014) show a TFR of 1.50.

Fertility rates are unlikely to return to the highs observed in the 1950s and early 1960s. Rather, it is believed that relatively small fluctuations around values below the replacement level are more likely.

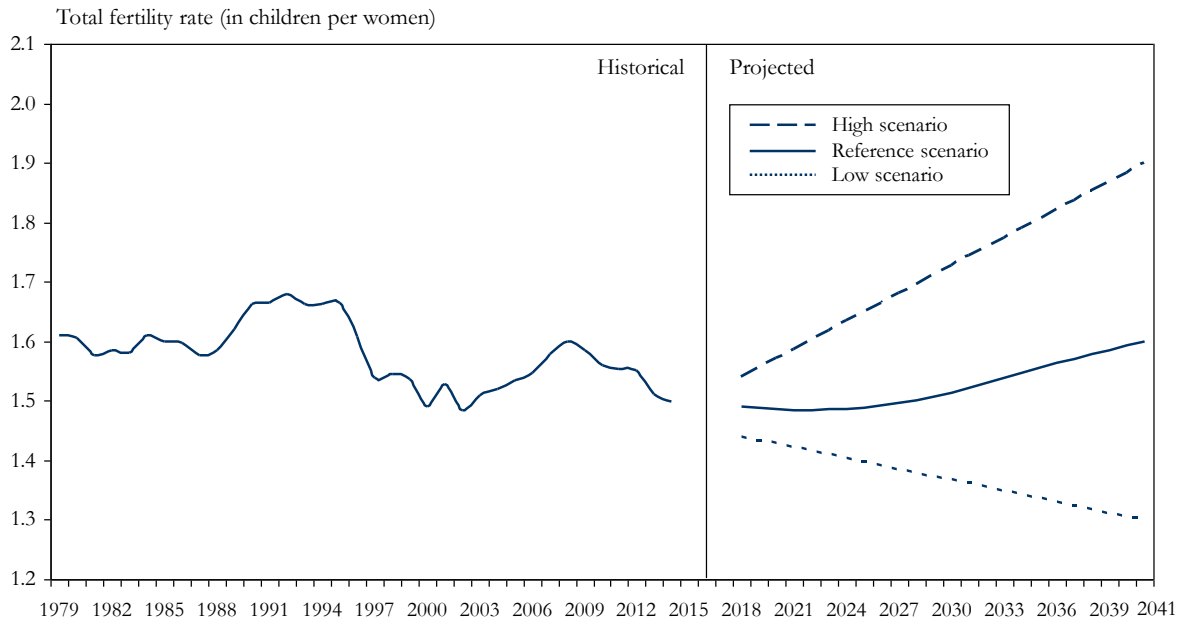

In the reference scenario, the TFR is assumed to increase slightly from 1.50 to 1.60 children per woman as younger women's fertility rates stabilize while those of older women continue to gradually increase.

In the low-growth scenario, fertility is assumed to decline gradually until the TFR reaches 1.30 children per woman at the end of the projection period. In the high-growth scenario, the TFR increases gradually to 1.90 children per woman by the end of the period.

### ***Fertility assumptions at the census division level***

The most recent data at the census division level (2014) shows that TFRs range from a high of 2.47 in Sudbury (District) to a low of 1.31 in Toronto. Trends in the evolution of the TFR in each census division over the past fifteen years show no convergence of TFRs by census division. For this reason, the projected parameters for fertility at the census division level are modelled to maintain the regional differences. The census division-to-province ratio for mean age at fertility in the most recent period is assumed to remain constant. The variance and skewness of fertility distributions at the census division level evolve over the projection period following the same absolute changes of these parameters at the Ontario level.

Chart 13  
**Total fertility rate of Ontario women, 1979 to 2041**

Sources: Statistics Canada, 1979–2014, and Ontario Ministry of Finance projections.

## Mortality

The projected number of deaths each year is obtained by applying age-specific mortality rates to population cohorts in corresponding ages. Assumptions of future age-specific death rates are derived<sup>2</sup> from trends observed over the 1971–2014 period related to the pace of improvement in overall life expectancy and the age patterns in mortality.

The province of Ontario has one of the highest levels of life expectancy in Canada and among the countries of the developed world. The current (2014) life expectancy at birth is 84.4 years for Ontario females and 80.4 years for Ontario males. Since 2004, average gains in life expectancy have been in the order of 0.18 years per annum for females and 0.24 years per annum for males.

Up to the mid-1990s, annual gains in life expectancy were getting somewhat smaller and it was expected that future improvements would continue at this slowing pace. However, over the past two decades, annual gains in life expectancy have picked up and are rising in a more linear trajectory. Future gains in life expectancy concentrated at older ages and are smaller for infants.

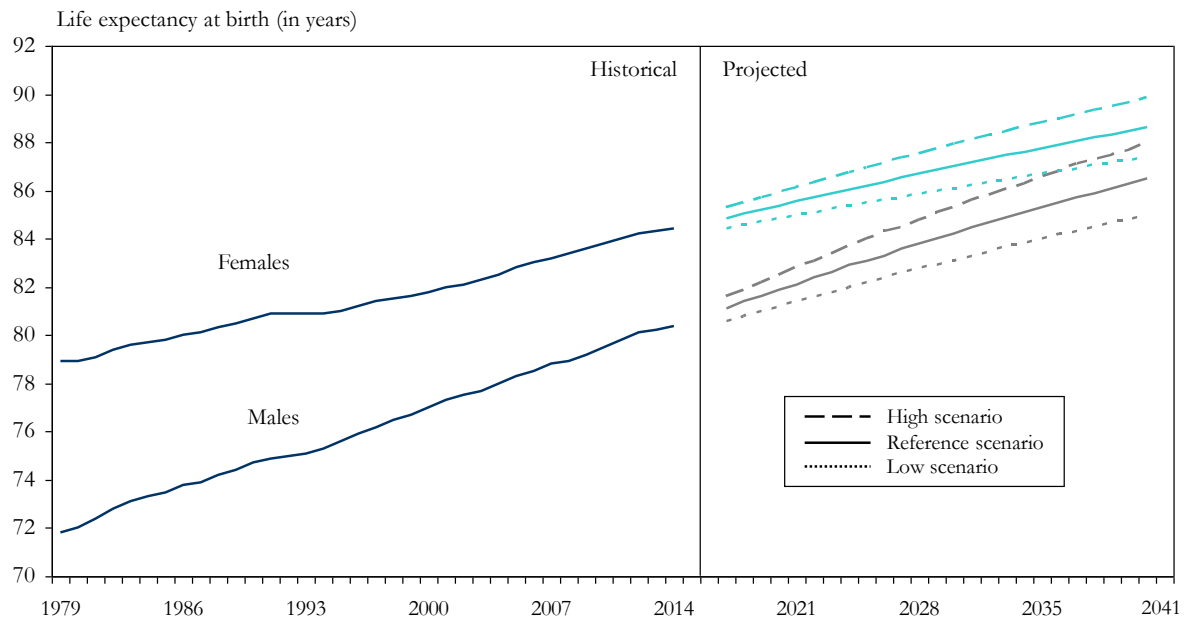

<sup>2</sup> Following the Lee-Carter model. See Glossary.

In the reference scenario, life expectancy in Ontario is projected to continue increasing linearly over the first decade of the projection, followed by a gradual slowing in the rate of increase. By 2041, life expectancy is projected to reach 86.6 years for males and 88.7 years for females. This means total life expectancy gains of 6.2 years for males and 4.3 years for females between 2014 and 2041.

The three scenarios for Ontario all reflect a continuation of the gains recorded in the average duration of life. However, life expectancy is assumed to increase at a diminishing rate over the projections period.

In the low-growth scenario, life expectancy increases at a slower pace, to 85.0 and 87.4 years for males and females respectively. In the high-growth scenario, life expectancy reaches 88.0 and 89.8 years for males and females respectively.

**Chart 14**  
**Life expectancy at birth by sex in Ontario, 1979 to 2041**

Sources: Statistics Canada, 1979–2014, and Ontario Ministry of Finance projections.

Under the assumptions on mortality for each of the three scenarios, male life expectancy is expected to progress at a faster pace than female life expectancy. This is consistent with recent trends where males have recorded larger gains than females. Thus, the overall gap between males and females has gradually decreased, and is projected to continue to do so.

Table B

**Life Expectancy in Ontario, 1981 to 2041**

		1981	1991	2001	2011	2021	2031	2041
Male	At birth	72.4	74.9	77.3	79.8	82.1	84.5	86.6
	At age 65	14.4	15.7	17.0	19.1	20.7	22.4	23.9
Female	At birth	79.1	80.9	82.0	84.0	85.5	87.2	88.7
	At age 65	18.8	19.7	20.3	21.9	23.1	24.4	25.5

Sources: Statistics Canada, 1981–2011, and Ontario Ministry of Finance projections.

***Mortality assumptions at the census division level***

At the census division level, the mortality assumptions were developed using a ratio methodology. The Ontario-level mortality structure was applied to each census division's age structure over the most recent six years of comparable data and the expected number of deaths was computed. This was then compared to the actual annual number of deaths for each census division over this period to create ratios of actual-to-expected number of deaths. These ratios were then multiplied by provincial age-specific death rates to create death rates for each census division. These were then applied to the corresponding census division population to derive the number of deaths for each census division.

An analysis of the ratio of actual-to-expected deaths for each census division did not reveal a consistent pattern or movement toward a convergence or divergence among regions over time. For this reason, the recent three-year average ratio for each census division was held constant over the projection period.

**Components of net migration**

The following sections discuss assumptions and methodology for the components of net migration, including immigration, emigration, non-permanent residents, interprovincial migration and intraprovincial migration.

**Immigration**

Immigration levels in Canada are determined by federal government policy. The federal Minister of Immigration, Refugees and Citizenship sets the national target and target-range for the level of immigration to be achieved over the following year(s). For the calendar year 2018, the target is set at 310,000, with a target-range of 290,000 to 330,000 immigrants. This is a slightly higher target compared to 2017 (300,000), but a significant increase from 2015, when the range was 260,000 to 285,000.

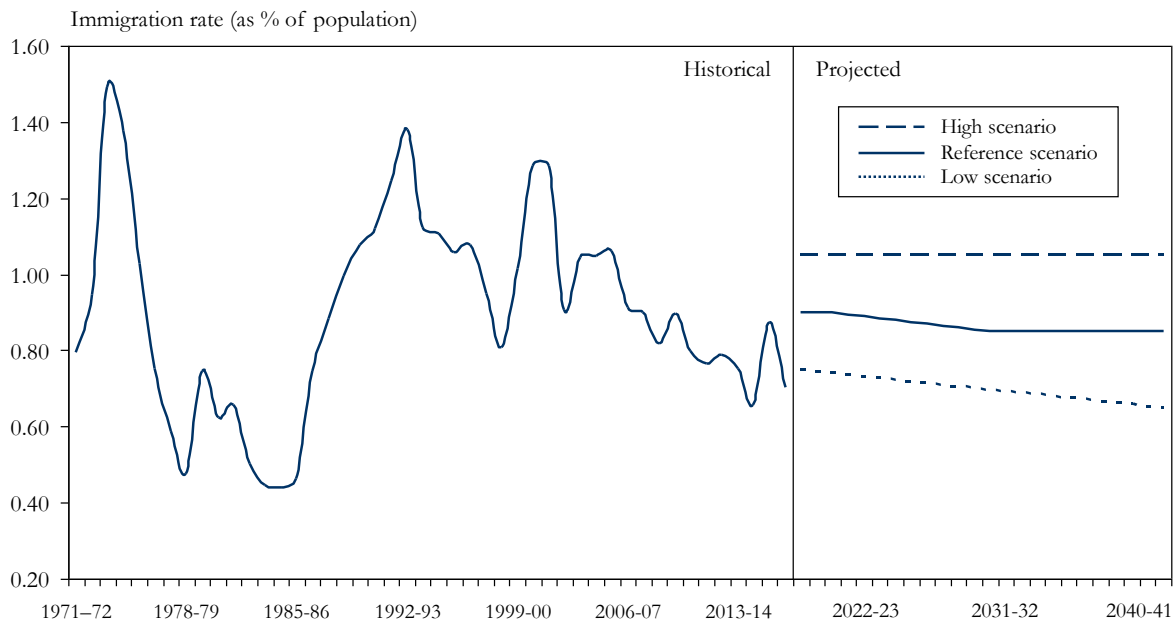

Over the past 20 years, the target range has been increased gradually by successive federal governments. More recently, a significant increase was announced, which would bring the national immigration level to 340,000 by 2020. This represents a 25 per cent increase from 2015.

Since the early 2000s, federal immigration policy has changed, with a goal of spreading immigrants more evenly across the country primarily through the expansion of the provincial nominee program. As a result, Ontario’s share of total Canadian immigration has fallen from 60 per cent in 2001–02 to an average of 37 per cent over the three years to July 1, 2017.

In the reference scenario, the assumed long-term immigration rate is set at 0.9 per cent for the first three projected years, followed by a gradual decline to 0.85 per cent by 2030.

**Chart 15**  
**Rate of immigration to Ontario, 1971 to 2041**

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

The number of immigrants increases over time as population grows. In the reference scenario, the annual immigration level is projected to increase from 128,000 in 2017–18 to 156,000 by 2040–41, in tandem with overall population growth.

The long-term immigration rate is set at 0.6 per cent in the low-growth scenario, resulting in relatively stable immigration levels, hovering around the 108,000 mark. In the high-growth scenario, the long-term rate of immigration is set at 1.0 per cent, resulting in immigration levels rising strongly, from 149,000 in 2017–18 to 215,000 by 2040–41.

***Immigration assumptions at the census division level***

Projected immigration shares for each census division are based on the trends observed in the distribution of immigrants by census division over the recent past. These shares evolve throughout the projection period following established trends. The average age-sex distribution pattern for

immigrants observed over the past five years is assumed to remain constant over the entire projection period. Over 80 per cent of immigrants coming to Ontario in 2016–17 were aged 0–44.

Chart 16  
Immigration to Ontario, 1971 to 2041

Sources: Statistics Canada, 1971-2017, and Ontario Ministry of Finance projections.

## Emigration

Total emigration is defined as the gross flow of international emigration, minus returning emigrants, plus the net variation in the number of Ontarians temporarily abroad. The level of total emigration from Ontario averaged 17,600 over the past three years.

The number of emigrants is difficult to estimate with a high degree of accuracy because of incomplete information. Statistics Canada publishes annual estimates of these flows based on a variety of sources, such as administrative data files and immigration statistics published by agencies of foreign countries.

In the reference scenario, the average emigration rates by age and sex for each census division observed over the past five years are used to model the projected number of people emigrating annually from each census division. The modelling is dynamic, taking into account the annual changes in age structure within census divisions. For Ontario as a whole, this results in the number of emigrants increasing gradually over the projection period to reach 21,300 by 2040–41.

In the low-growth scenario, emigration rates by age and sex used in the reference scenario are increased by 30 per cent, making them 130 per cent of recently-observed rates. This results in emigration levels reaching 24,900 by 2040–41.

In the high-growth scenario, emigration rates by age and sex used in the reference scenario are reduced by 30 per cent, making them equivalent to 70 per cent of recently-observed rates. This results in the number of emigrants reaching 16,500 by 2040–41.

Chart 17  
**Emigration from Ontario, 1971 to 2041**

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

### *Emigration assumptions at the census division level*

The projected number of people, by age and gender, emigrating from each census division for each year of the projections is modelled using the average emigration rates by age and gender for each census division observed over the past five years.

### **Non-permanent residents**

Statistics Canada estimates that there were about 415,000 non-permanent residents (NPRs: e.g., foreign students, temporary workers, refugee claimants) living in Ontario on July 1, 2017. In 2016–17, the number of NPRs rose by 69,300 in Ontario, the largest increase in 28 years. These foreign residents are included in the base population as they are counted in the Census.

The year-to-year change in their total number must be accounted for as a component of population growth. Determining assumptions for this component is complicated by the significant annual fluctuations and the transient nature of this group.

Over the past 30 years, Ontario has gained on average 9,700 non-permanent residents annually. The reference scenario reflects long-term trends in the annual change in the number of NPRs by setting the long-term yearly gain to 7,500. In the low- and high-growth scenarios, the long-term annual

change in the stock of NPRs is set at 2,500 and 12,500 respectively. The long-term assumptions for each scenario are reached after a transition period of five years, moderating from the relatively high net gains observed recently. The assumed increase in the number of non-permanent resident in 2017–18 is set at 70,000 in the reference scenario, 52,500 in the low-growth scenario, and 87,500 in the high-growth scenario

Chart 18

**Annual change in the number of non-permanent residents living in Ontario, 1971 to 2041**

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

***Non-permanent resident assumptions at the census division level***

Projected shares of non-permanent residents for each census division are based on the share held by each census division in 2017. The age-sex distribution of non-permanent residents is based on the average of the last five years. The distribution pattern is assumed to remain constant over the projection period.

**Interprovincial migration**

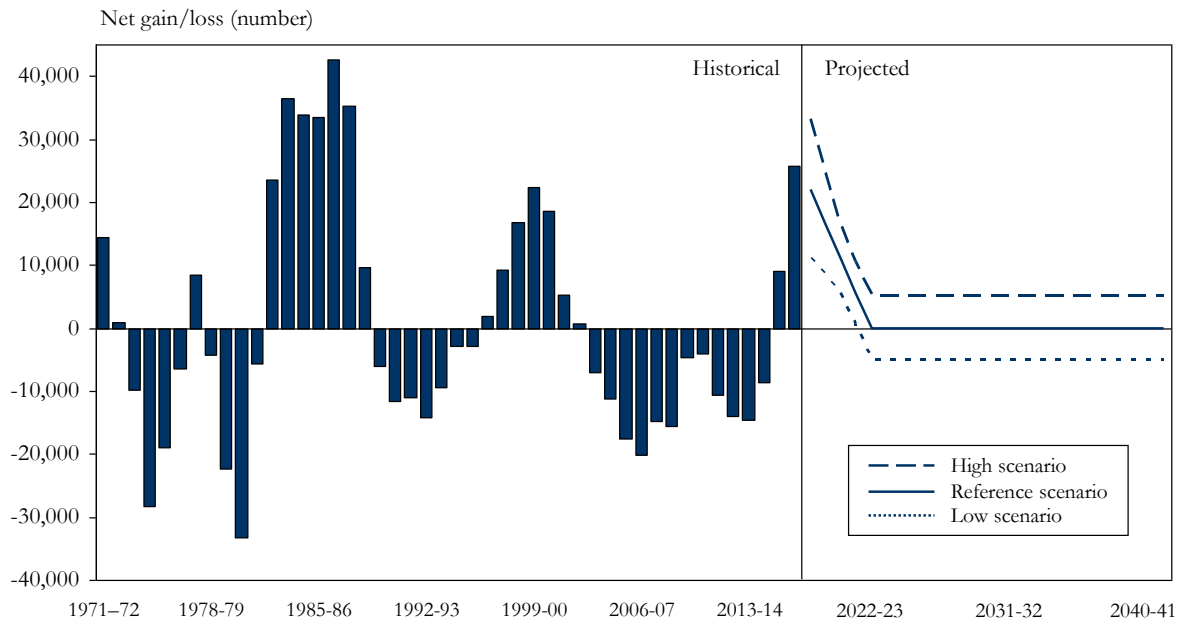

Interprovincial migration is a component of population growth that fluctuates significantly from year to year. Although Ontario remains a major province of attraction for migrants from some other provinces, trend analysis of the last three decades reveals a mixed pattern of several years of gains followed by several years of losses. This pattern is usually closely tied to economic cycles.

Over the past 30 years, net interprovincial migration has not contributed to Ontario’s population growth, with net losses averaging about 1,500 people per year. Between 2003 and 2015, net

interprovincial migration to Ontario was negative, largely due to net outflows to Alberta. However, the most recent data shows a reversal of the out-migration trends.

In the reference scenario, annual net interprovincial migration for Ontario reflects recent trends in the short term. It is set at 22,000 for 2017–18, 16,500 for 2018–19, and gradually returning to long-term historical values by 2021–22 with a net of zero and then remaining at that level for the rest of the projection period.

Chart 19  
**Net interprovincial migration in Ontario, 1971 to 2041**

Sources: Statistics Canada, 1971–2017, and Ontario Ministry of Finance projections.

In the low-growth scenario, net interprovincial migration for Ontario is set at 11,000 for 2017–18, 8,200 for 2018–19, and gradually falling to a net outflow of 5,000 from 2021–22 onwards. In the high-growth scenario, a net annual inflow of 33,000 people is assumed for 2017–18, 24,800 for 2018–19, followed by a gradual decrease to a net inflow of 5,000 annually starting in 2021–22.

The annual in-flows corresponding to the long-term net migration levels in the low-growth, reference and high-growth scenarios are 62,500, 65,000 and 67,500 respectively. The corresponding annual out-flows are 67,500, 65,000 and 62,500.

***Interprovincial migration assumptions at the census division level***

Each census division’s share of Ontario inflow and outflow of interprovincial migrants over the last five years is applied to projected flows for the province and held constant throughout the projection period.

## **Intraprovincial migration**

At the census division level, intraprovincial migration, or the movement of population from one census division to another within the province, is a significant component of population growth. This component affects population growth only at the census division level.

The annual number of intraprovincial migrants in Ontario has fluctuated within the 350,000 to 430,000 range over the past 20 years. Over the projection period, the annual number of intraprovincial migrants increases gradually from 390,000 in 2017–18 to 436,000 in 2040–41. This increase over time reflects population growth and age structure changes at the census division level. In fact, even as the number of intraprovincial migrants is projected to increase, the resulting rate of intraprovincial migration in Ontario declines slightly over the projection period, from 2.7 per cent in 2017–18 to 2.4 per cent by 2040–41.

### ***Intraprovincial migration assumptions at the census division level***

The projected number of people, by age, leaving each census division for each year of the projections, as well as their destination within the province, is modelled using the origin-destination migration rates by age for each census division over the past five years. Because migration rates by age group are different for each census division and because different age groups have different origin-destination behaviours, the methodology provides a powerful tool to project movers based on observed age and origin-destination migration patterns. The modelling is dynamic, taking into account the annual changes in age structure within census divisions.

The evolution of intraprovincial migration patterns in each census division was studied to identify specific trends and the intraprovincial migration rate assumptions were adjusted to account for these trends.

## Glossary

---

### Baby boom generation

People born during the period following World War II, 1946 to 1965, marked by a significant increase in fertility rates and in the number of births.

### Baby boom echo generation

People born during the period 1972 to 1992. Children of baby boomers.

### Cohort

Represents a group of persons who have experienced a specific demographic event during a given period, which can be a year. For example, the birth cohort of 1966 consists of the number of persons who were born in 1966.

### GTA

The Greater Toronto Area, comprised of the census divisions of Toronto, Durham, Halton, Peel and York.

### International migration

Movement of population between Ontario and a foreign country. International migration includes immigrants, emigrants and non-permanent residents. Net international migration is the difference between the number of people entering and the number of people leaving the province from foreign countries.

### Interprovincial migration

Movement of population between Ontario and the rest of Canada. Net interprovincial migration is the difference between the number of people entering Ontario from the rest of Canada and the number of people leaving Ontario for elsewhere in Canada.

### Intraprovincial migration

Movement of population between the 49 census divisions within Ontario. Net intraprovincial migration for a given census division is the difference between the number of people moving from the rest of Ontario to this census division and the number of people leaving for elsewhere in the province.

### Lee-Carter method

A method of mortality projection proposed by Lee and Carter used to generate annual age-sex specific mortality rates. See Lee, Ronald D., and Carter, Lawrence, 1992. "Modeling and Forecasting the Time Series of U.S. Mortality," *Journal of the American Statistical Association* 87, no 419 (September):659-71.

### Life expectancy

A statistical measure derived from the average number of years of life remaining for a person at a specific age if that person would experience during his/her life the age-specific mortality rates observed in a given year.

### **Median age**

The median age is the age at which exactly one half of the population is older and the other half is younger. This measure is often used to compare age structures between jurisdictions.

### **Natural increase**

The number of births minus the number of deaths.

### **Net migration**

Difference between the number of people entering and the number of people leaving a given area. This includes all the migration components included in net international migration, net interprovincial migration and net intraprovincial migration (for sub-provincial jurisdictions).

### **Non-permanent residents**

Foreign citizens living in Ontario (e.g., foreign students, temporary workers or refugee claimants).

### **Pearsonian curve**

Parametric model used to distribute estimated fertility rates by age of mothers. The Pearsonian curve has four parameters. The first of these parameters, the total fertility rate, reflects the level of fertility while the other three parameters (the mean age at fertility, the skewness and the variance of the distribution) reflect the timing, or age, at which women have their babies.

### **Population aging**

In demographic terms, population aging refers to an increasing share of seniors (ages 65+) in the population.

### **Population estimates**

Measures historical resident population using data from the most recent Census, in addition to administrative data on the components of demographic change (births, deaths and net migration) since the Census.

### **Total fertility rate**

The sum of age-specific fertility rates during a given year. Indicates the average number of children that a generation of women would have if, over the course of their reproductive life, they had fertility rates identical to those of the year considered.

Sources: Statistics Canada estimates, 2006-2017, and Ontario Ministry of Finance projections.

Notes:

1. Population age structure is for the beginning of each Census year, i.e., July 1.

2. For 2017-18, population and age structure are Statistics Canada estimates for July 1, 2017.

3. For historical components of demographic growth, Statistics Canada's residual deviation is included in net migration.
